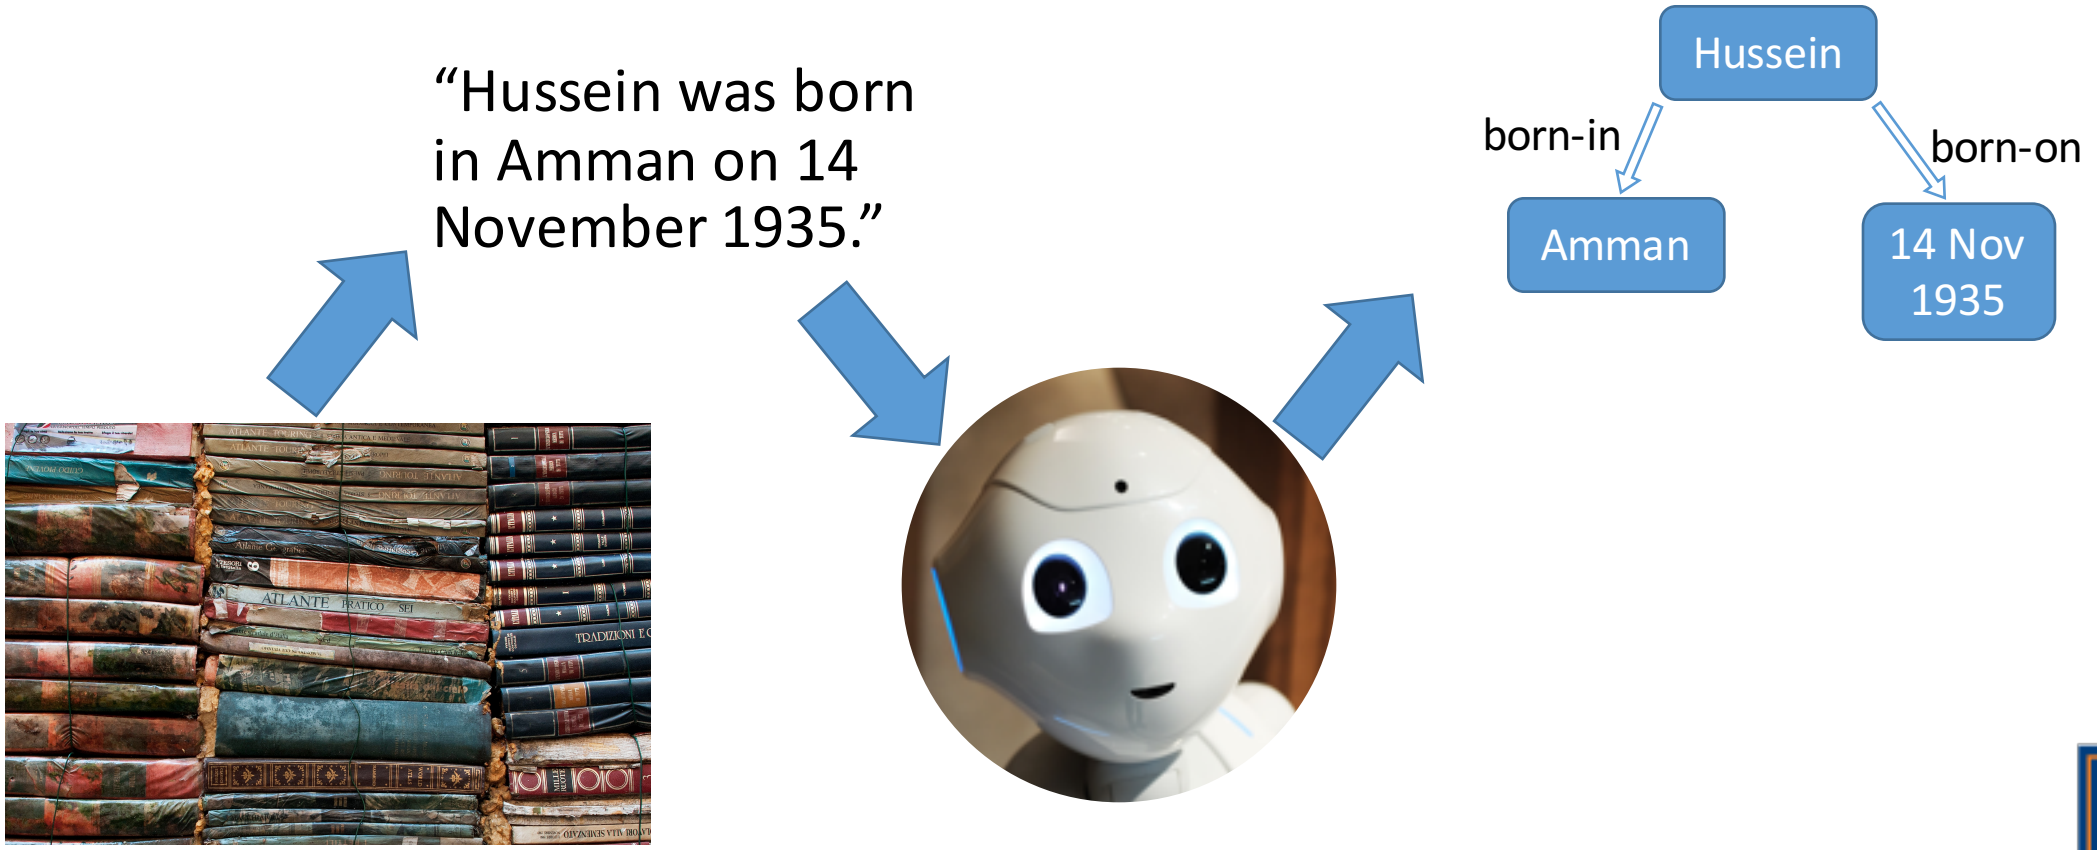
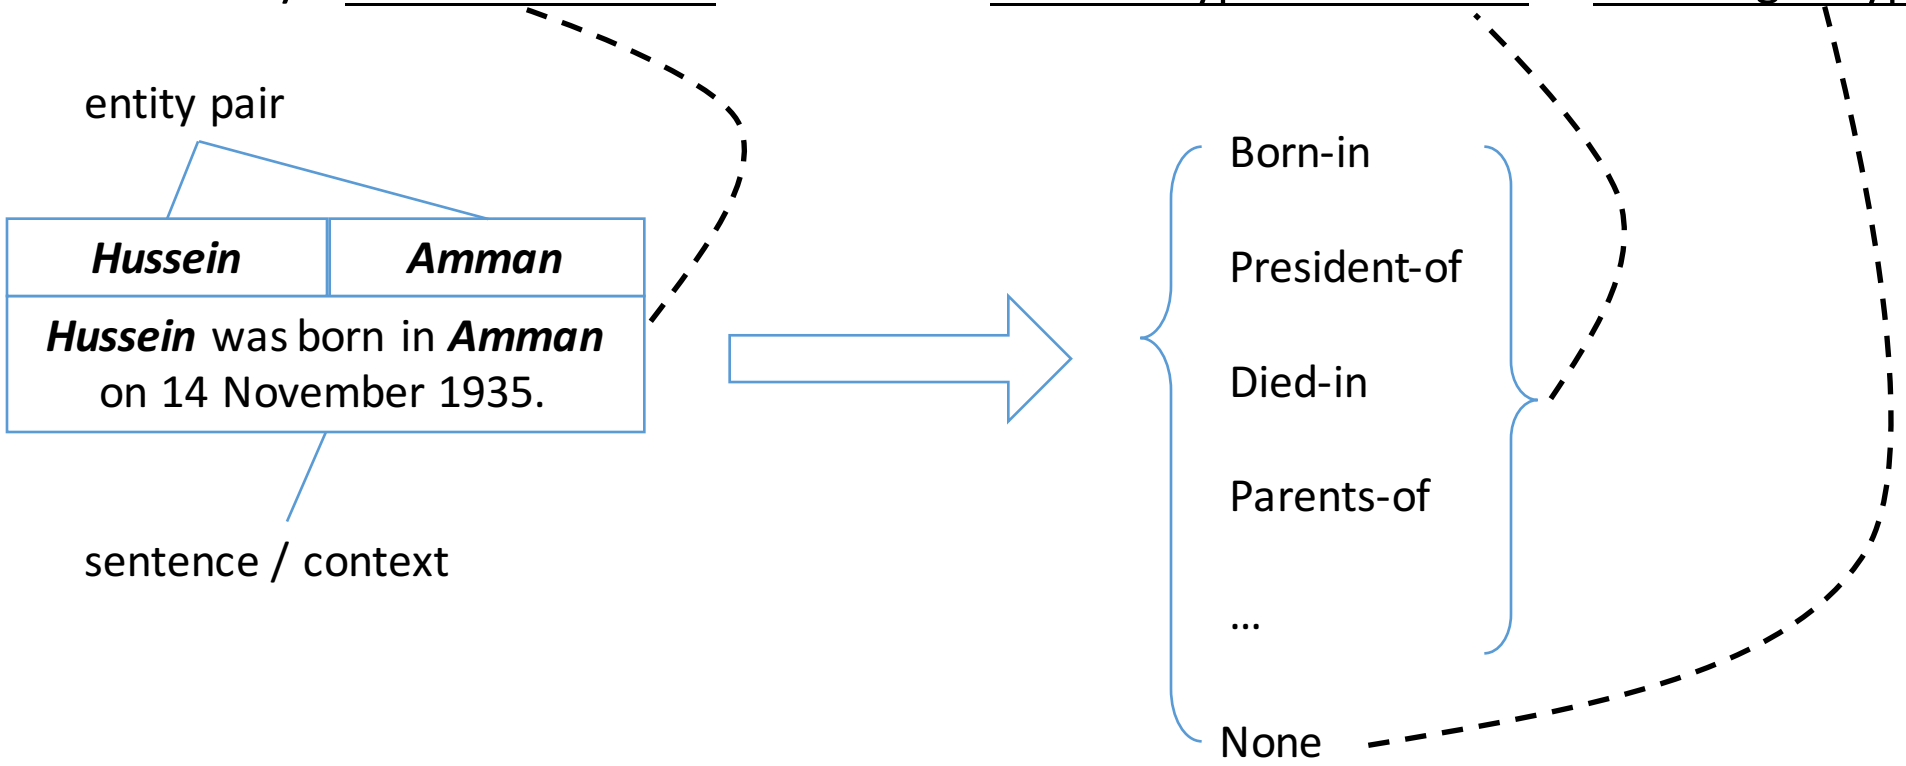
Relation Extraction

- Goal: acquire structured knowledge from unstructured text



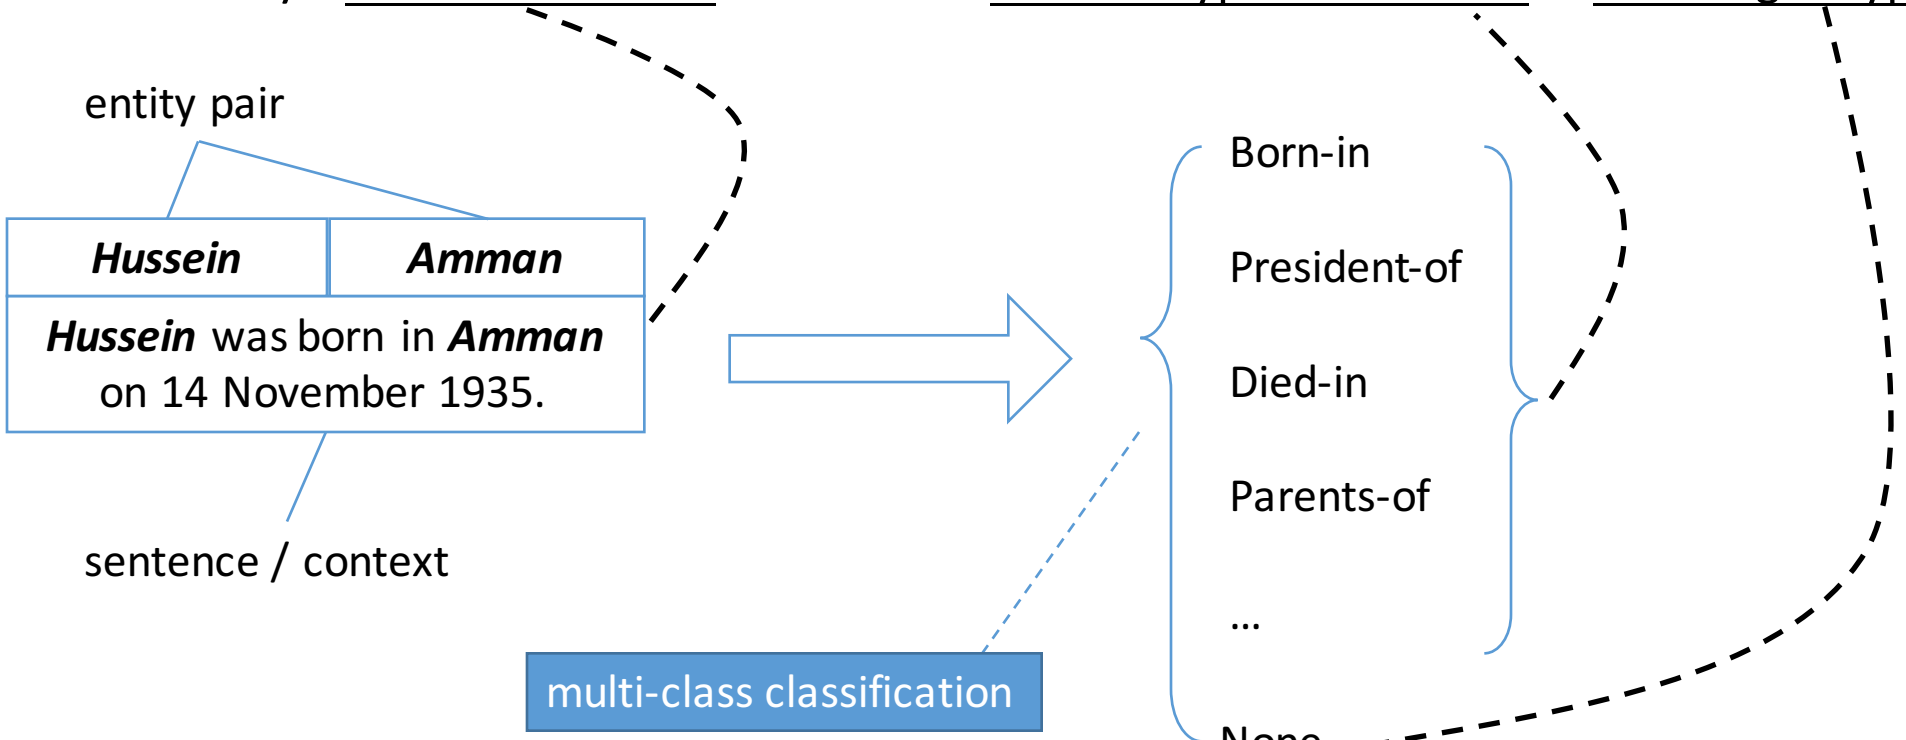
Relation Extraction

- Formal Definition:
  - Sentence-level relation extraction:
    - Classify a relation mention into a set of relation types of interest or Not-Target-Type (None)



Relation Extraction

- Formal Definition:
  - Sentence-level relation extraction:
    - Classify a relation mention into a set of relation types of interest or Not-Target-Type (None)



Related Work

- Supervised Learning:
  - Multi-class classification

Related Work

- Supervised Learning:

Dataset with human annotation is the bottleneck

- Limited, might even not existed for many domains
- Hard to get, and costly
- Slow, and sometimes outdated
- ……

Related Work

- Bootstrap learning:
  - Start with a set of seed patterns / annotations, iteratively generate more
  - Suffers from semantic shift

Mintz et al. “Distant supervision for relation extraction without labeled data”, ACL 2009

Related Work

- Distant Supervision:
  - Automatically generate annotations by Knowledge Base

Mintz et al. “Distant supervision for relation extraction without labeled data”, ACL 2009

Related Work

- Distant Supervision:
  - Automatically generate annotations by Knowledge Base
    - ("Obama", "USA", Obama was born in Honolulu, Hawaii, USA as he has always said)
      - *Born-in* (correct)
      - *President-of* (wrong).

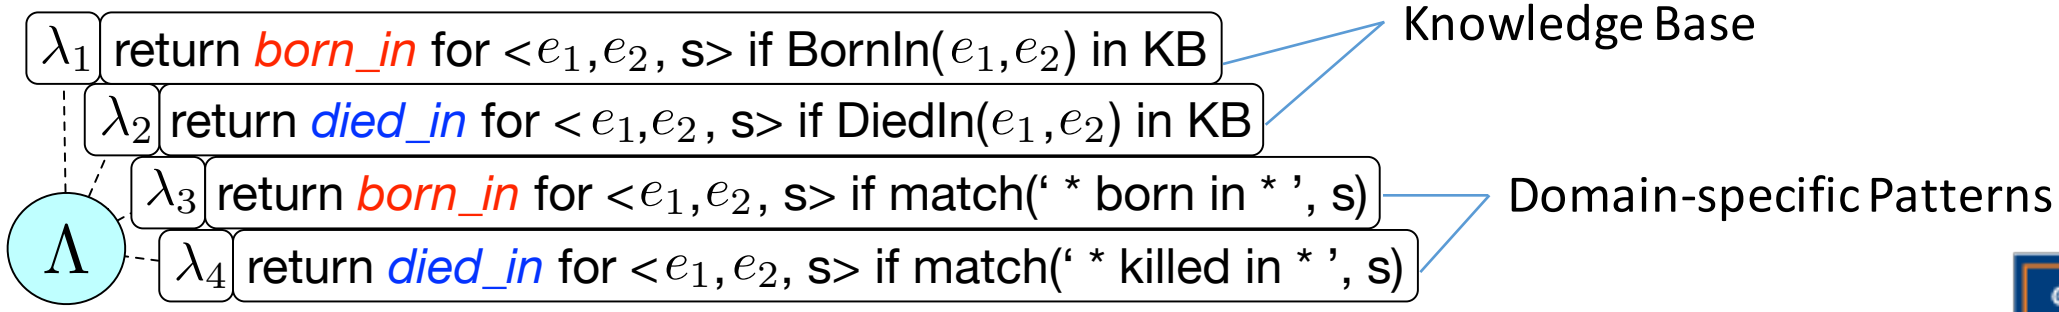
Related Work

- Distant Supervision:
  - Automatically generate annotations by Knowledge Base

Distant supervision only encodes KB, while we have more than KB

Heterogeneous Supervision

- Provide a general framework to encode knowledge for supervision:
  - Knowledge Base, domain-specific patterns, ……
- Labelling functions:



Ratner, Alexander J., et al. "Data programming: Creating large training sets, quickly." NIPS. 2016.

Heterogeneous Supervision & Distant Supervision:

- Heterogeneous Supervision is an extension of Distant Supervision:
  - Both encode external information and provide supervision,
  - Heterogeneous Supervision can encode more.

Information type	KBP		NYT	
	# of Relation Types	# of Relation Mentions	# of Relation Types	# of Relation Mentions
Knowledge Base	7	133955	25	530767
Domain-specific Patterns	13	225977	16	43820

Table1. Statistic of Heterogeneous Supervision

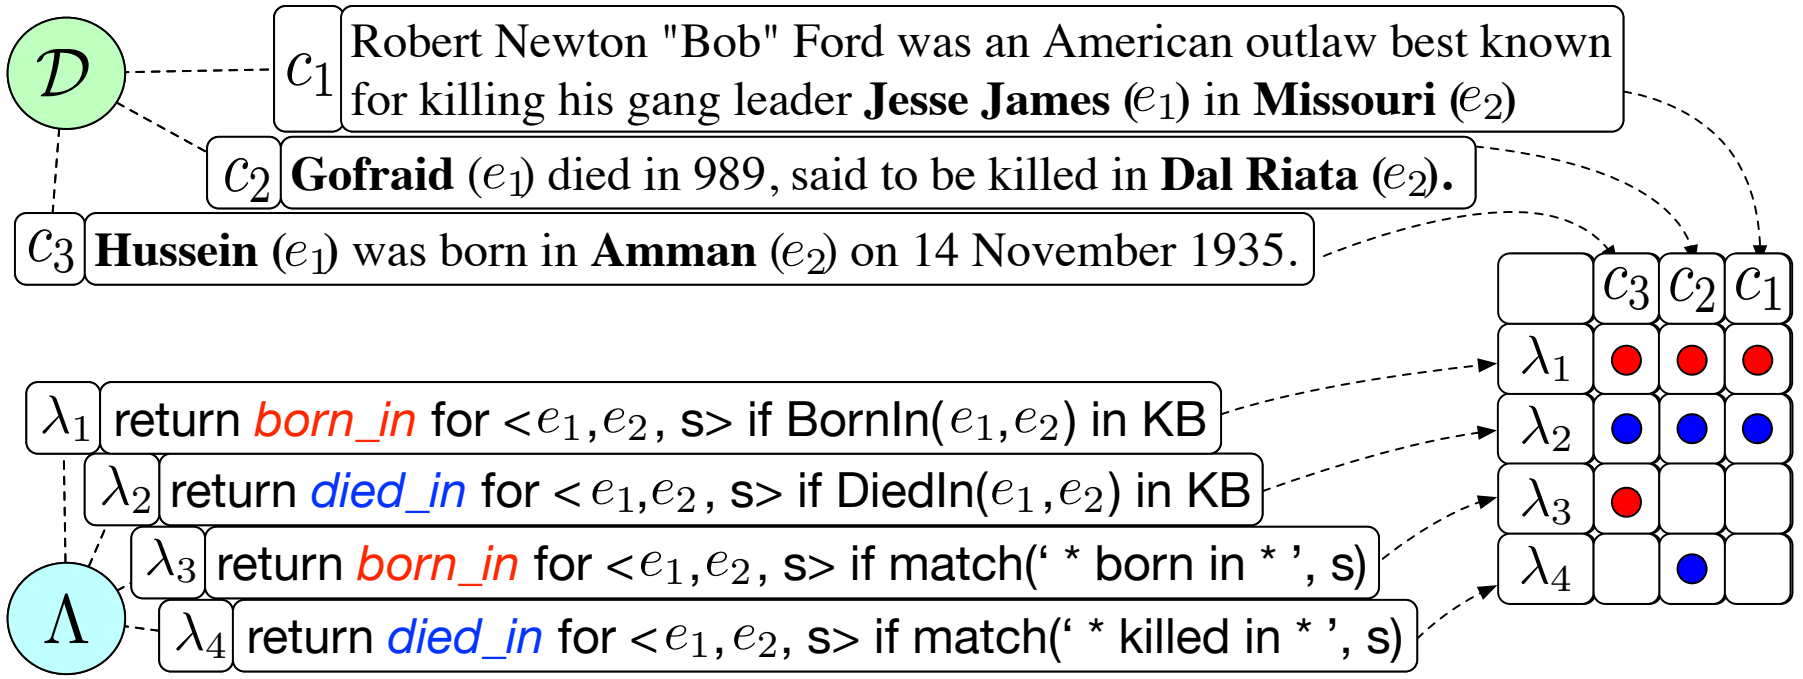
Challenges

- Relation Extraction
- Resolve Conflicts among Heterogeneous Supervision



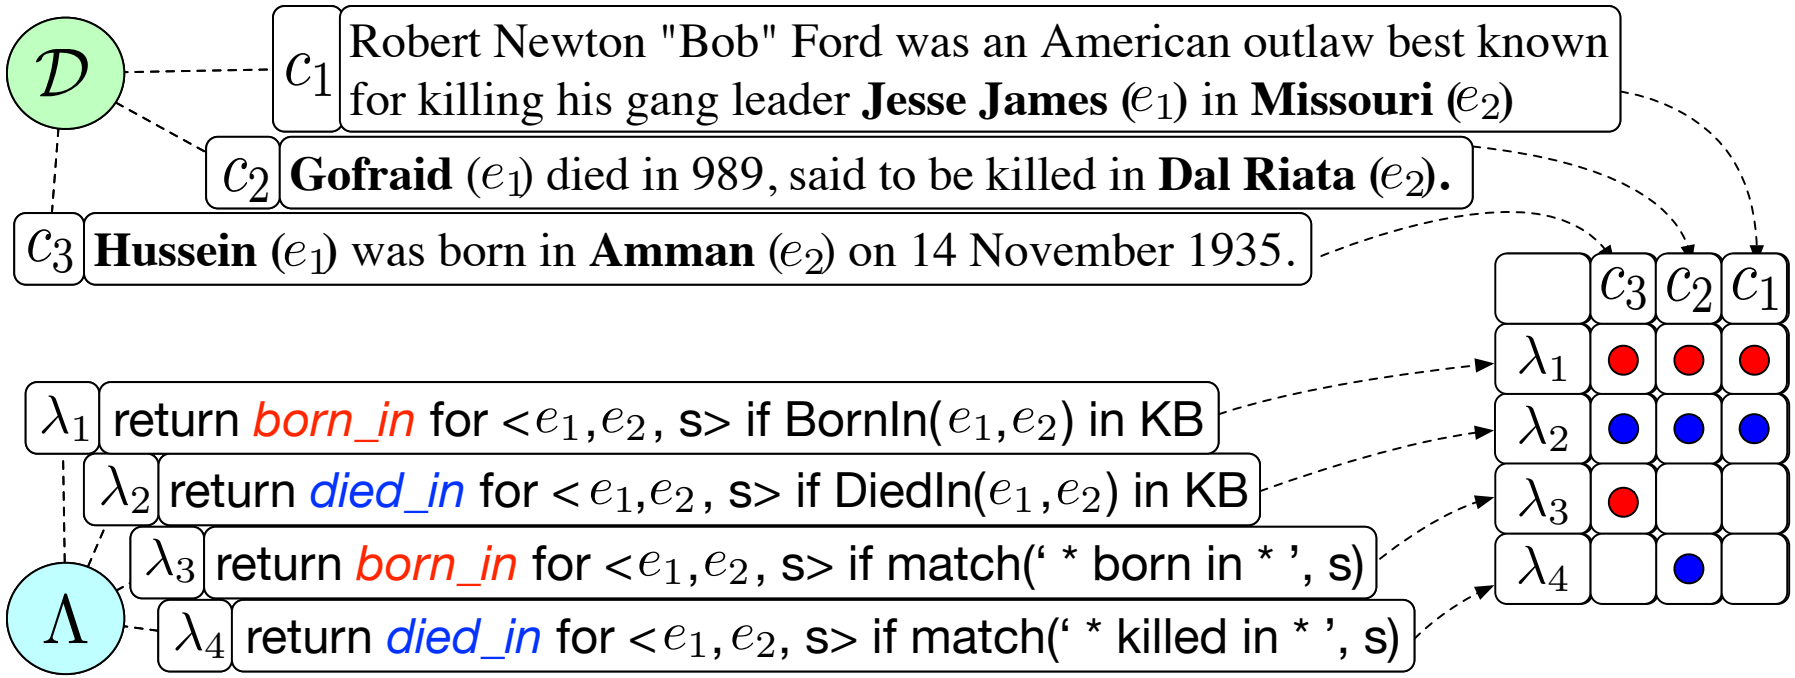
ReHession

- Heterogeneous Supervision

- Our Solution: A Representation Learning Approach
  - Relation Mention Representation
  - True Label Discovery component
  - Relation Extraction component
- Experiments

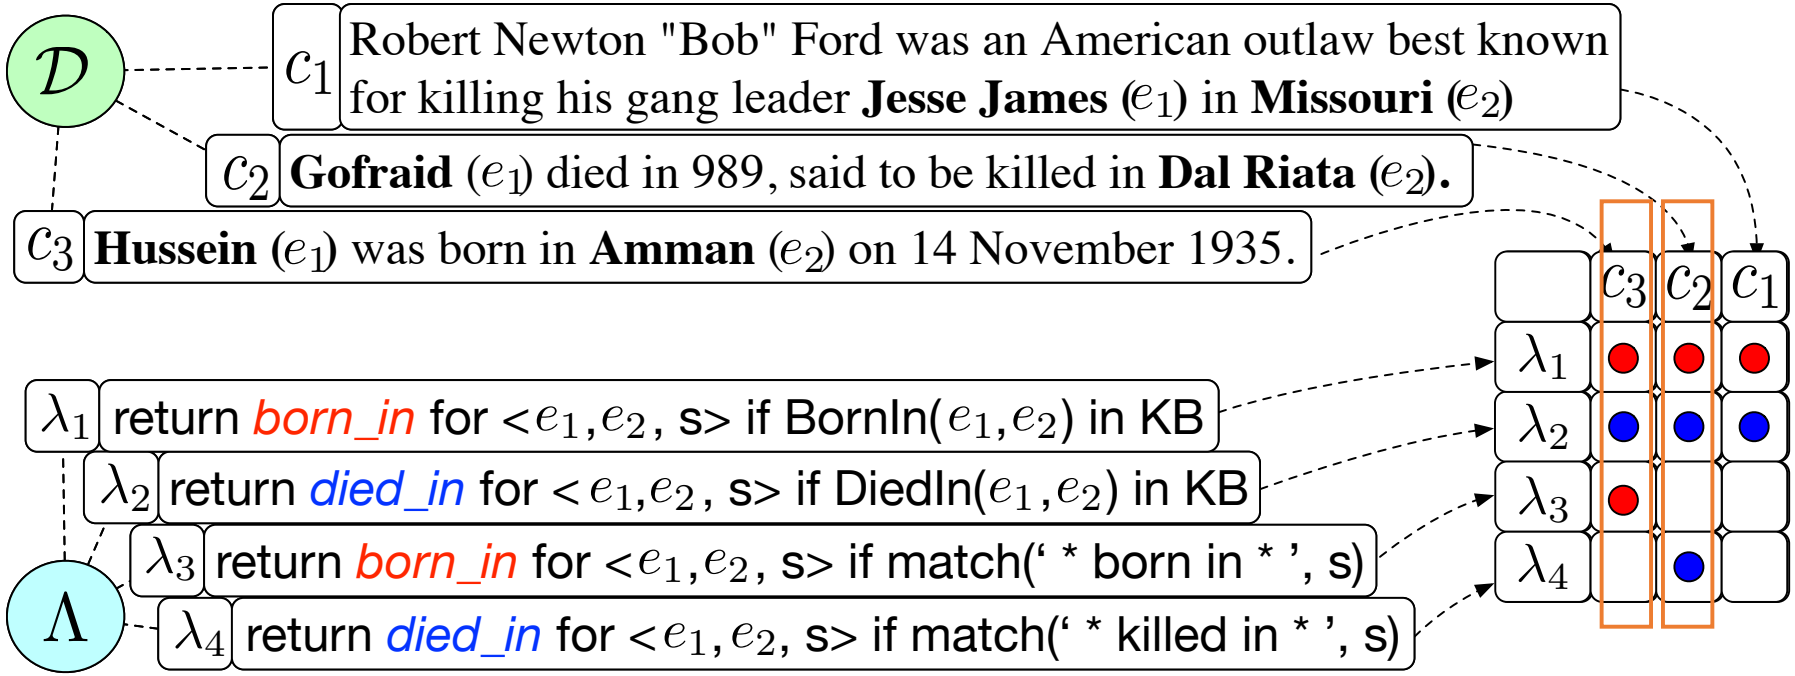
Conflicts among Heterogeneous Supervision

- Most simple way: majority voting



Conflicts among Heterogeneous Supervision

- How to resolve conflicts among Heterogeneous Supervision?
  - Works for C3 and C2, but not work for C1



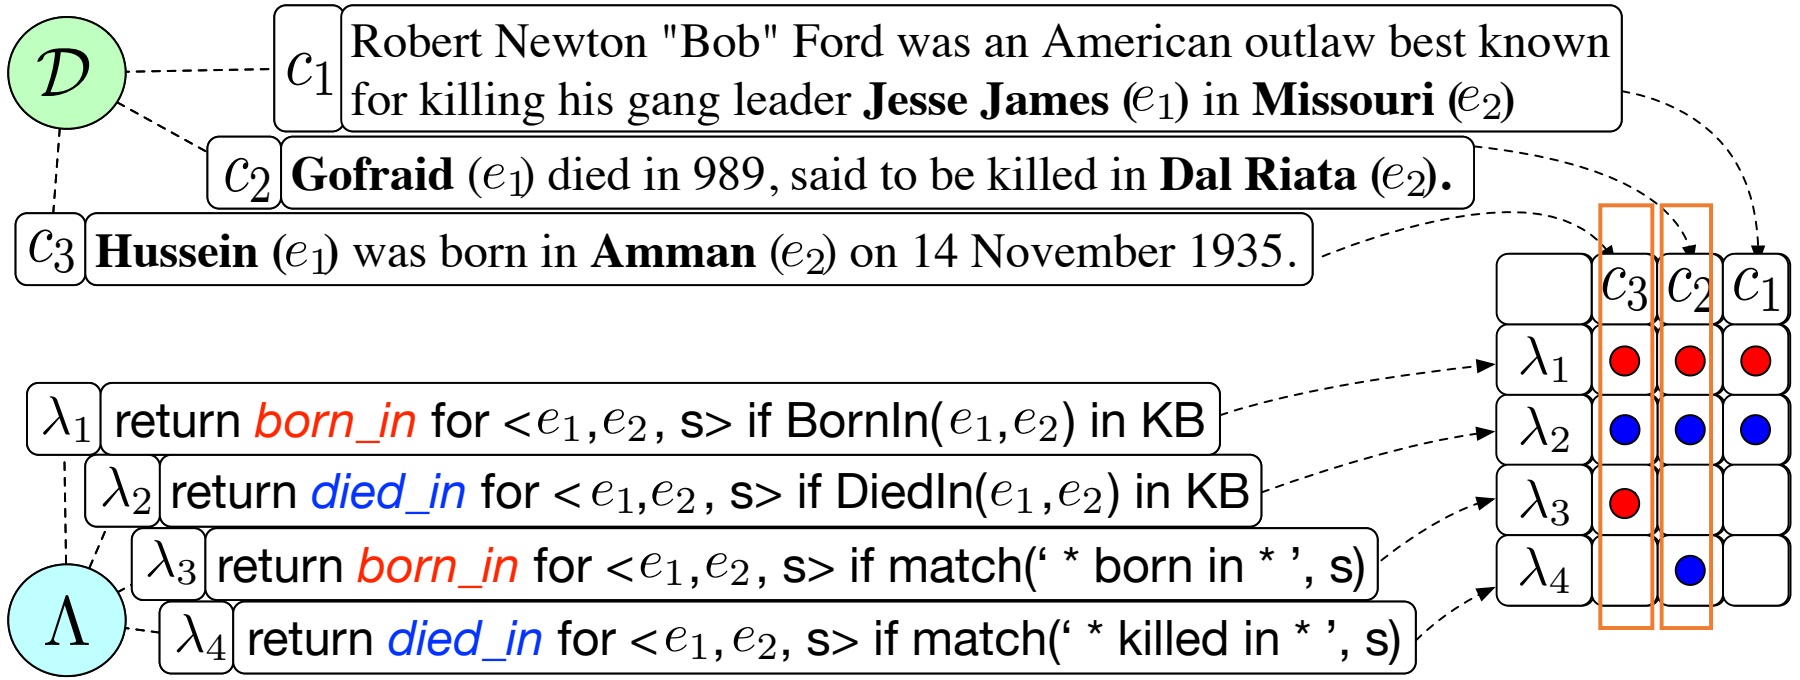
Conflicts among Heterogeneous Supervision

- For more complicated models, several principles have been proposed:
  - Truth Discovery:
    - Some sources (labeling functions) would be more reliable than others
    - Refer the reliability of different sources and the true label at the same time
    - Source Consistency Assumption: a source is likely to provide true information with the same probability for all instances.

Li, Yaliang, et al. "A survey on truth discovery." Acm Sigkdd Explorations Newsletter 17.2 (2016): 1-16.

Conflicts among Heterogeneous Supervision

- For more complicated models, several principles have been proposed:
  - Truth Discovery:
    - May not fit our scenario very well



Conflicts among Heterogeneous Supervision

- For more complicated models, several principles have been proposed:
  - Truth Discovery:
    - These models are context-agnostic, while context is important for Relation Extraction

Conflicts among Heterogeneous Supervision

- For more complicated models, several principles have been proposed:
  - Truth Discovery:
  - Distant Supervision:
    - Partial-label association has been proposed to resolve conflicts among Distant Supervision, and proved to be effective.

$$l(z, O_z) = \max\{0, 1 - \left[\max_{r \in O_z} \phi(z, r) - \max_{r' \notin O_z} \phi(z, r')\right]\}$$

Most likely positive relation type

Most likely negative relation type

Xiang Ren, et al. "CoType: Joint Extraction of Typed Entities and Relations with Knowledge Bases", WWW, 2017.

Conflicts among Heterogeneous Supervision

- For more complicated models, several principles have been proposed:
  - Truth Discovery:
  - Distant Supervision:
    - Partial-label association has been proposed to resolve conflicts among Distant Supervision, and proved to be effective.

$$l(z, O_z) = \max\{0, 1 - \left[\max_{r \in O_z} \phi(z, r) - \max_{r' \notin O_z} \phi(z, r')\right]\}$$

    - For Distant Supervision, all annotations come from Knowledge Base.
    - For Heterogeneous Supervision, annotations are from different sources, and some could be more reliable than others.

Conflicts among Heterogeneous Supervision

- To fit our problem, we introduce context awareness to truth discovery, and modified the assumption:
  - A source is likely to provide true information with the same probability for instances *with similar context*.

Heterogeneous Supervision

- To fit our assumption, we add one constraint to labeling functions:
  - each labeling function can annotate ***only one*** relation type based on ***one source*** of information

- Reasons:
  - Different information sources often have different reliabilities

  - Some sources annotate different relation types without consistency
    - KB-based labeling function may have higher recall on ‘president-of’ than ‘born-in’

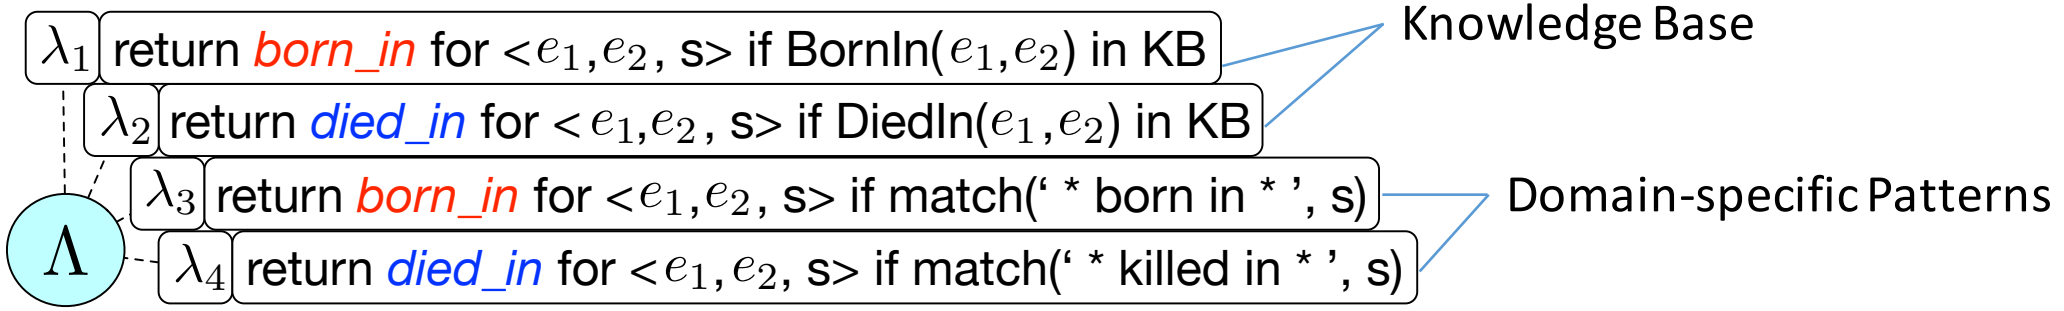
Heterogeneous Supervision

- To fit our assumption, we add one constraint to labeling functions:
  - each labeling function can annotate ***only one*** relation type based on ***one source*** of information

return ***r*** for <e1, e2, s> if ***r*** (e1, e2) in KB

Heterogeneous Supervision

- To fit our assumption, we add one constraint to labeling functions:
  - each labeling function can annotate ***only one*** relation type based on ***one source*** of information



ReHession

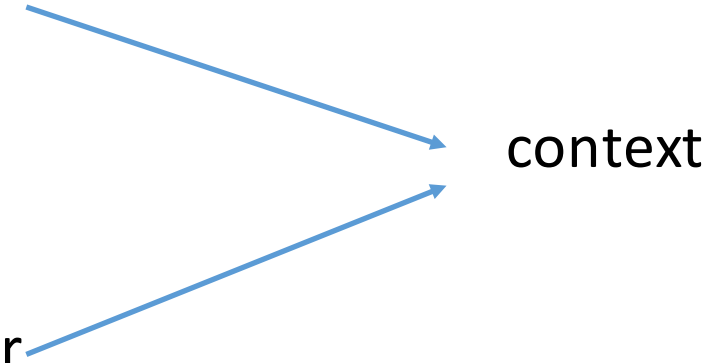
- Heterogeneous Supervision
- Our Solution: A Representation Learning Approach
  - Relation Mention Representation
  - True Label Discovery component
  - Relation Extraction component
- Experiments

Heterogeneous Supervision for Relation Extraction

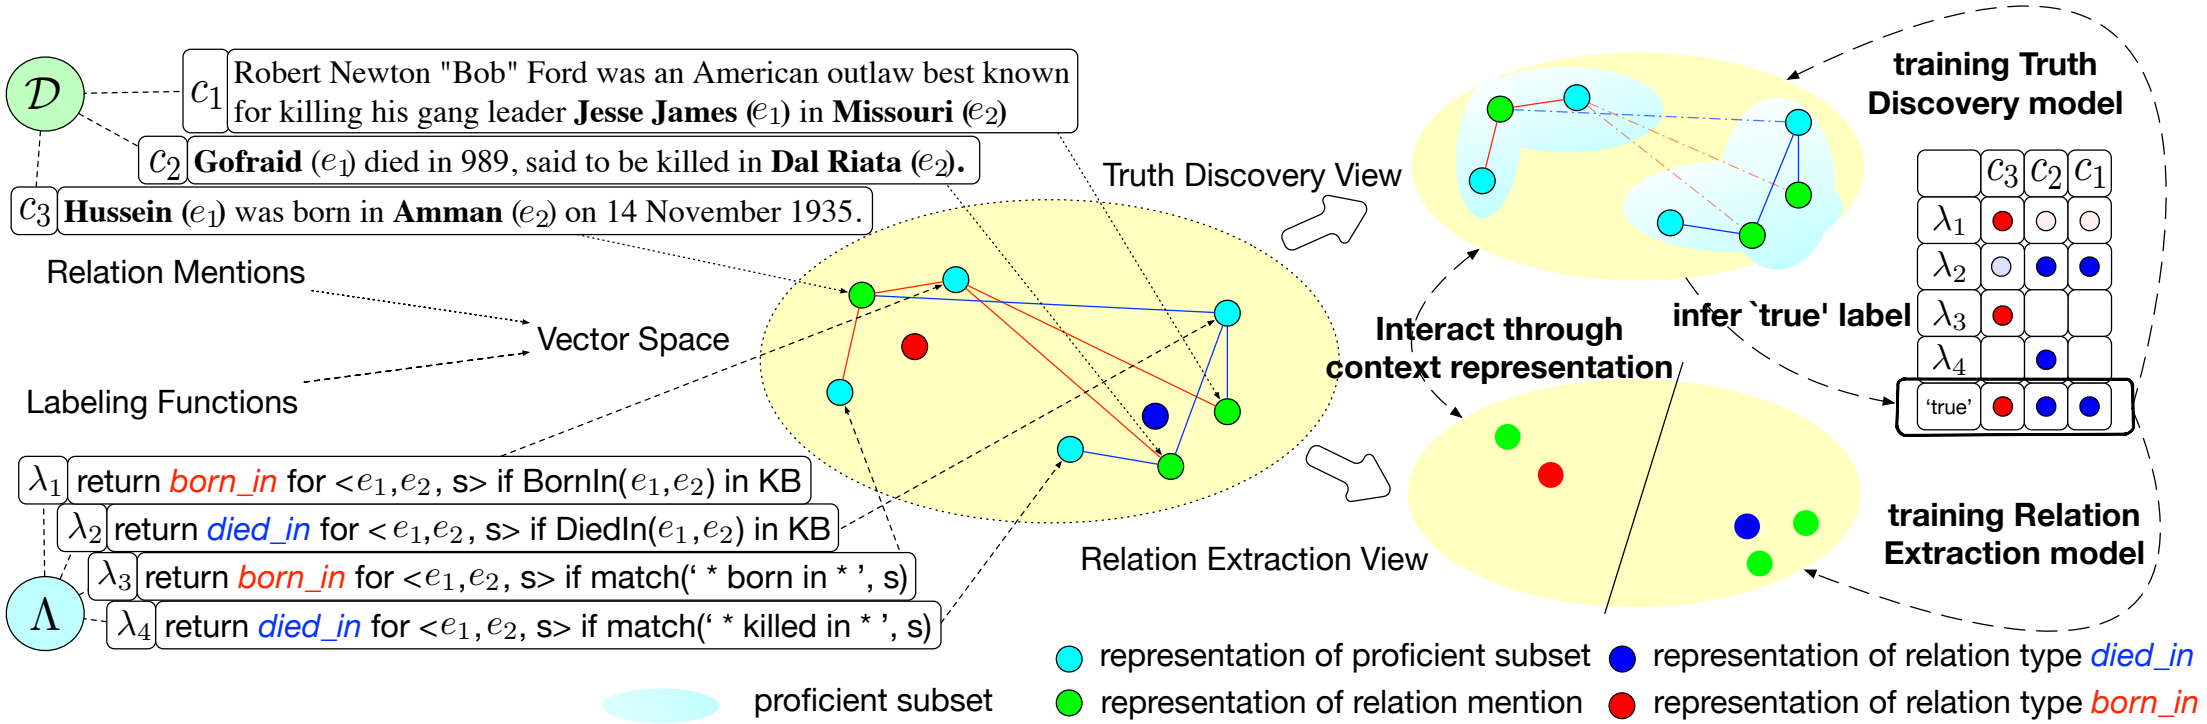
- Relation Extraction:
  - Matching context with proper relation type
- Heterogeneous Supervision:
  - Refer true labels in a context-aware manner

Heterogeneous Supervision for Relation Extraction

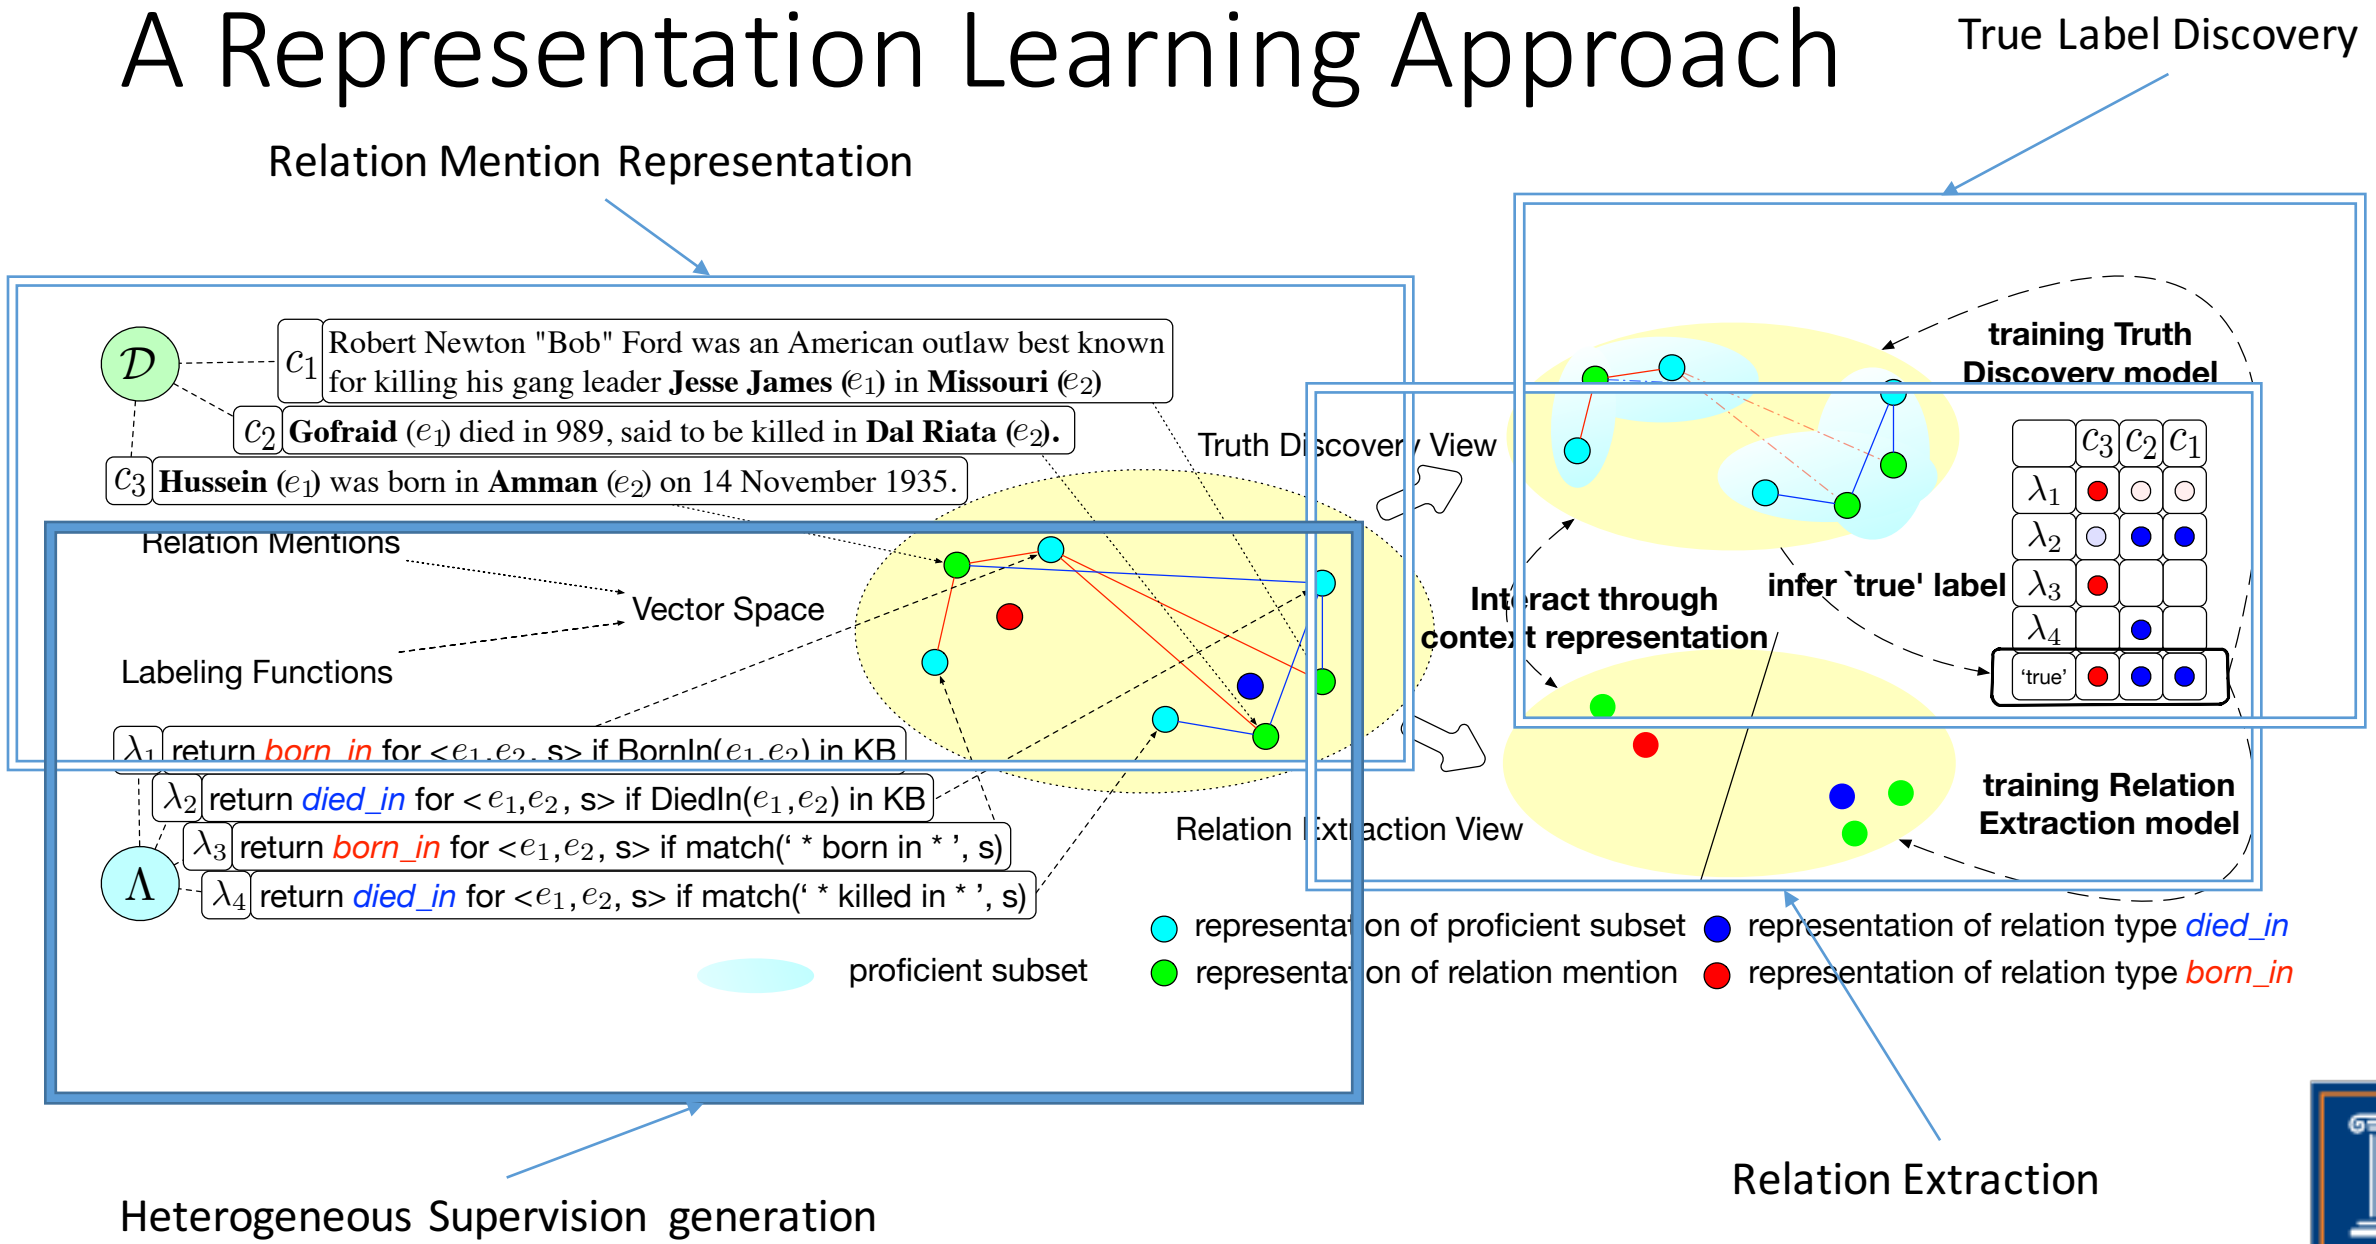
- Relation Extraction:
  - Matching ***context*** with proper relation type
- Heterogeneous Supervision:
  - Refer true labels in a ***context***-aware manner



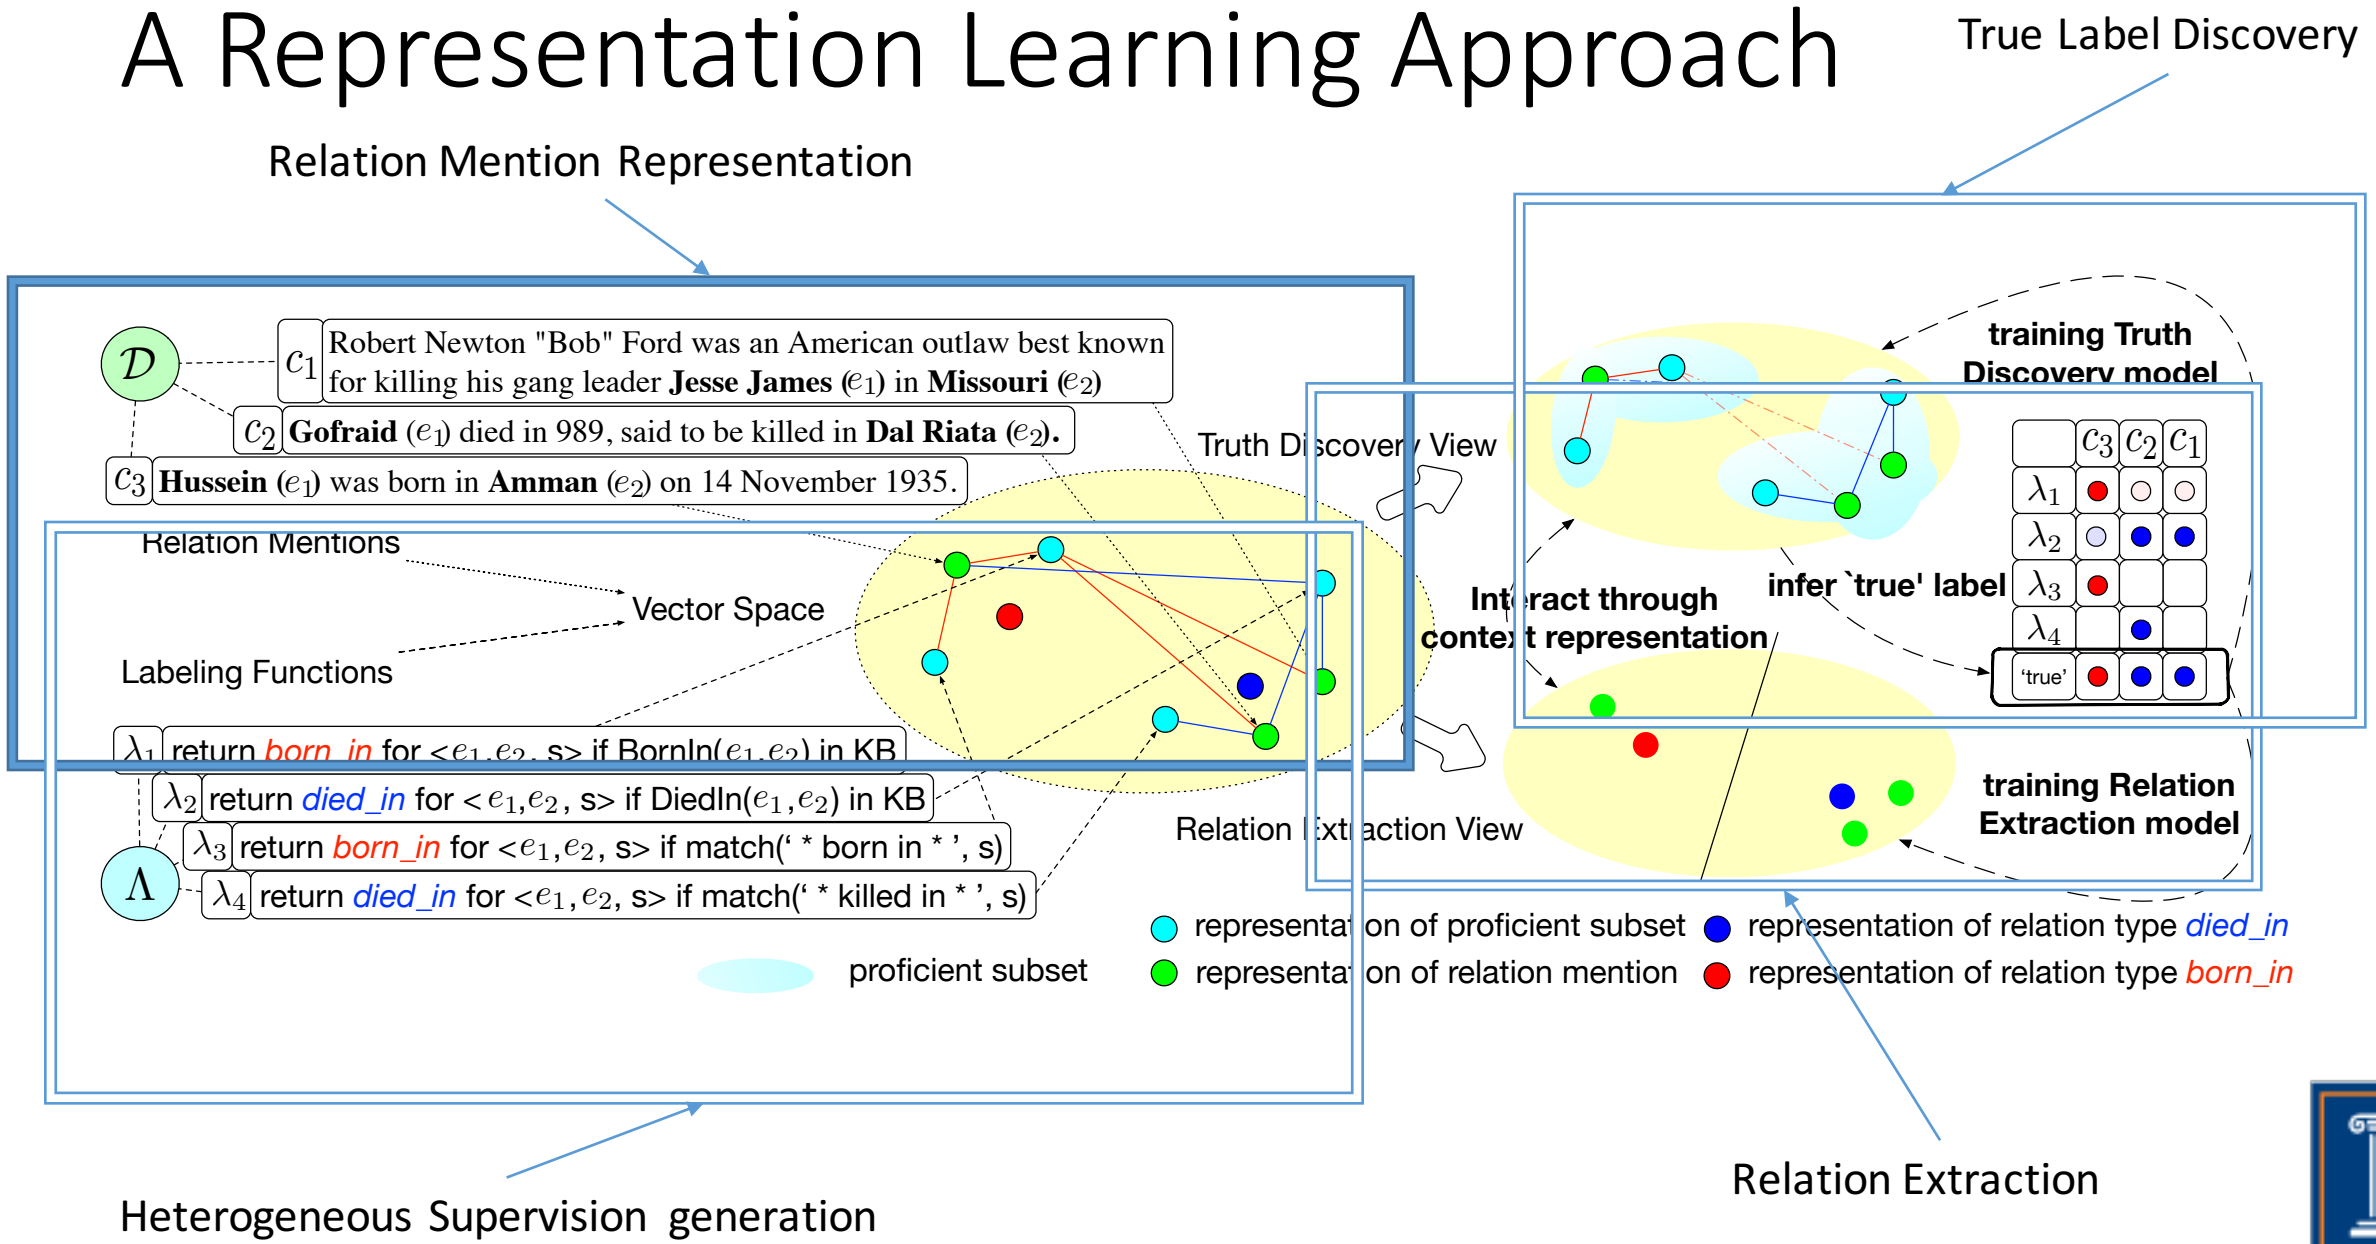
A Representation Learning Approach



A Representation Learning Approach

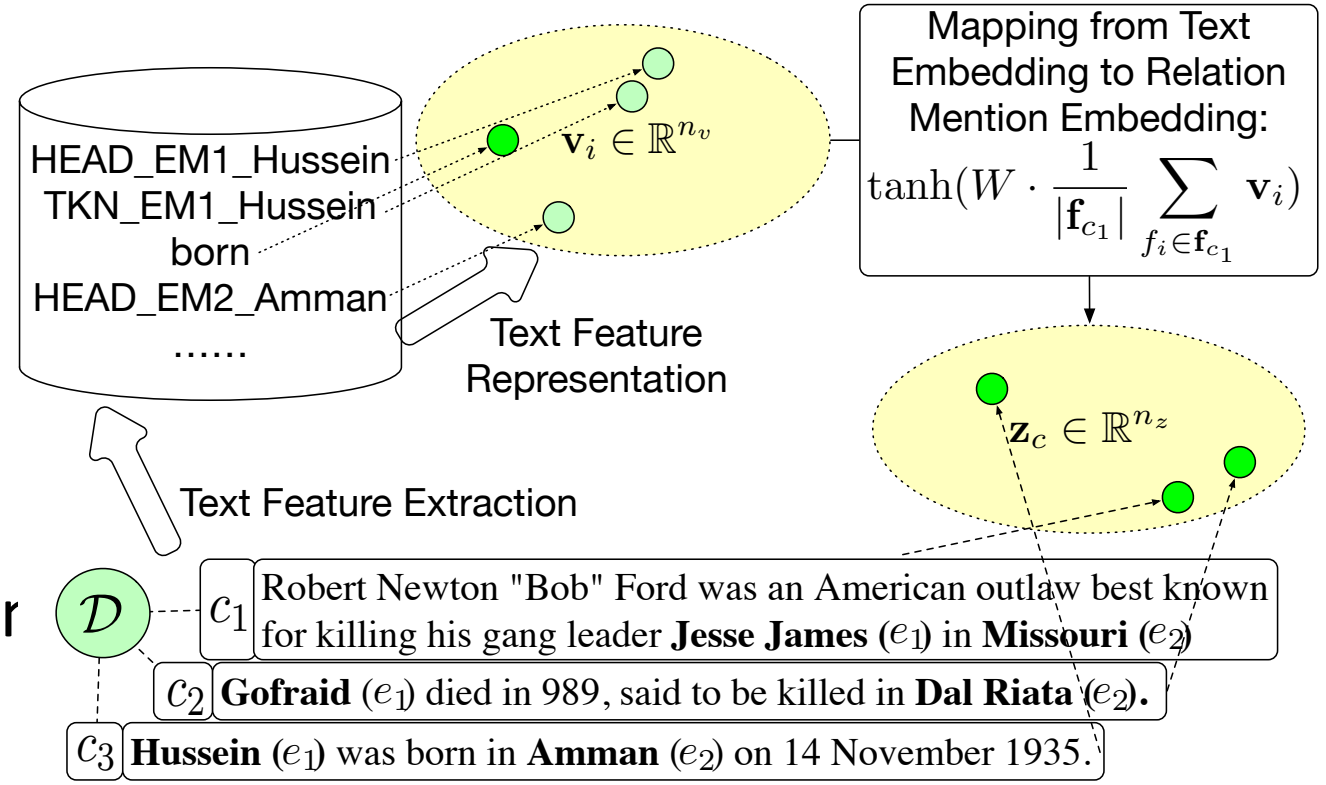


A Representation Learning Approach



Relation Mention Representation

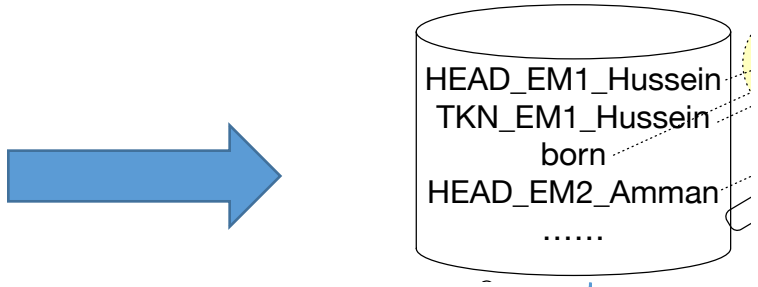
- Text Feature Extraction
- Text Feature Representation
- Relation Mention Representation



Text Feature Extraction

We adopted texture features, POS-tagging and **brown clustering** to extract features

C3: ***Hussein*** was born in ***Amman*** on 14 November 1935

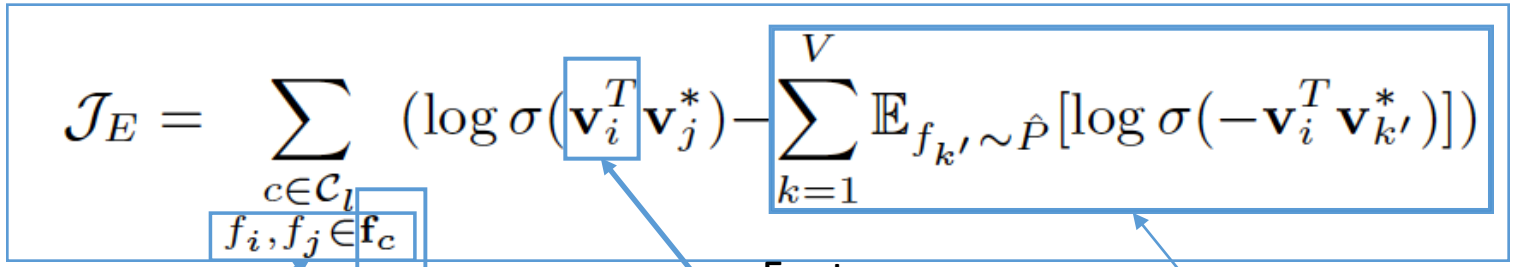


Feature	Description	Example
Entity mention (EM) head	Syntactic head token of each entity mention	"*HEAD_EM1_Hussein*", ...
Entity Mention Token	Tokens in each entity mention	"*TKN_EM1_Hussein*", ...
Tokens between two EMs	Tokens between two EMs	"*was*", "*born*", "*in*"
Part-of-speech (POS) tag	POS tags of tokens between two EMs	"*VBD*", "*VBN*", "*IN*"
Collocations	Bigrams in left/right 3-word window of each EM	"*Hussein was*", "*in Amman*"
Entity mention order	Whether EM 1 is before EM 2	"*EM1_BEFORE_EM2*"
Entity mention distance	Number of tokens between the two EMs	"*EM_DISTANCE_3*"
Body entity mentions numbers	Number of EMs between the two EMs	"*EM_NUMBER_0*"
Entity mention context	Unigrams before and after each EM	"*EM_AFTER_was*", ...
Brown cluster (learned on $\mathcal{D}$)	Brown cluster ID for each token	"*BROWN_010011001*", ...

Text Feature Representation

- Leverage features' co-occurrence information to learn the representation , and help the model generalize better.

- Loss function of this part:



Feature set of c

Feature embedding for feature f_i

Negative sampling

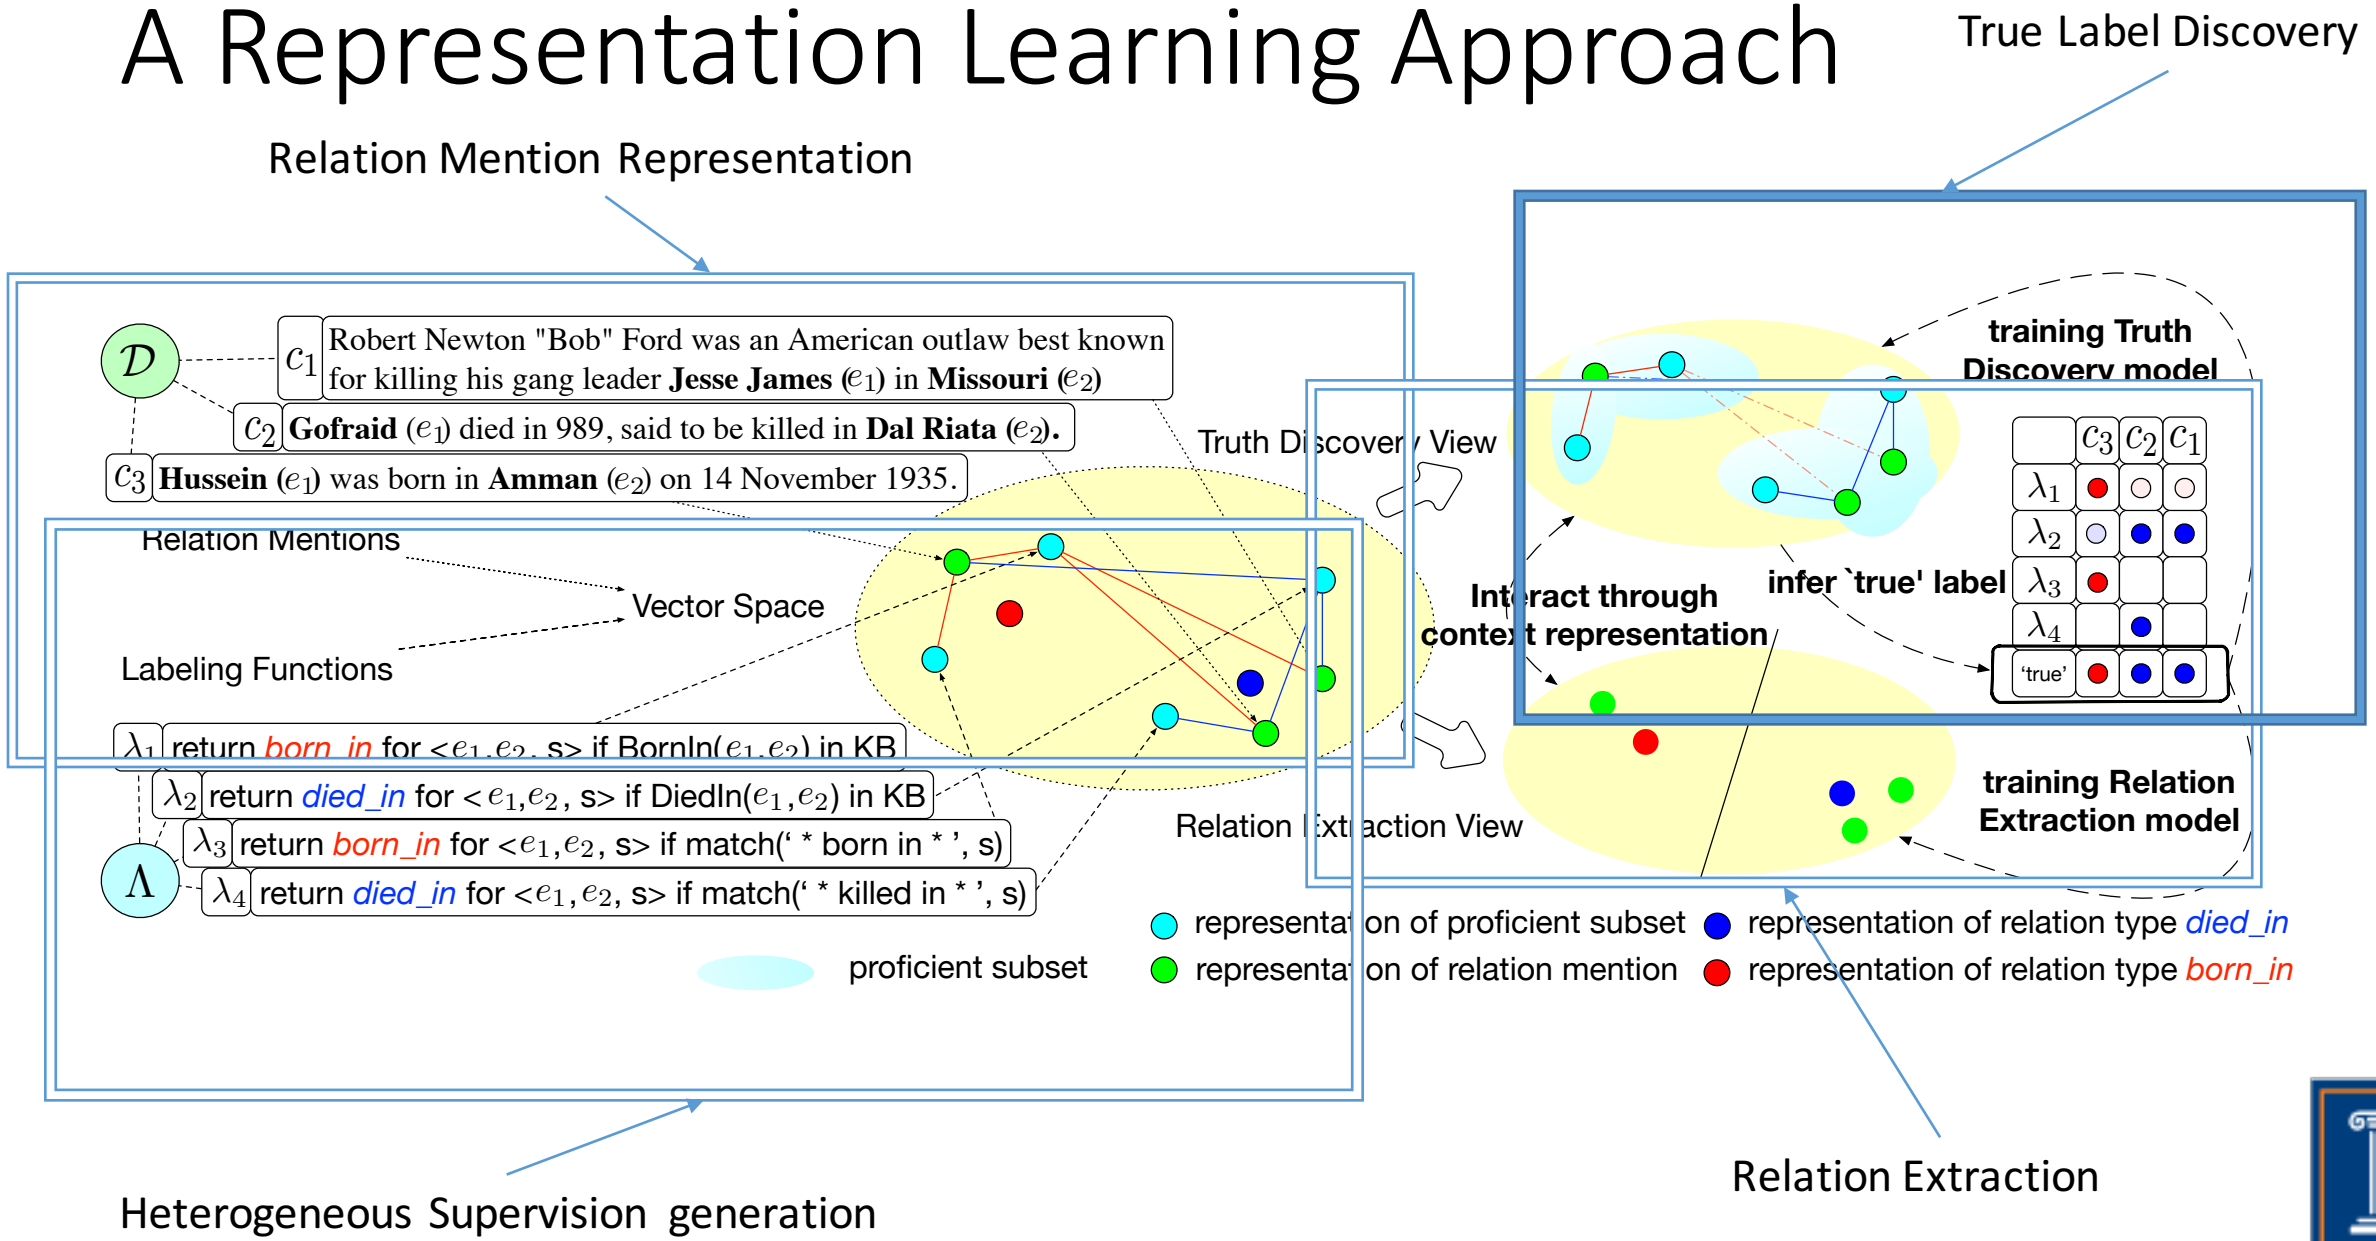
co-occurrence here refers to features occur in the same relation mention instead of the same shifting window

Relation Mention Representation

- Here, we adopted the bag-of-features assumption, and add transformation weights to allow representation of relation mention and features to be in different semantic space.

$$\mathbf{z}_c = g(\mathbf{f}_c) = \tanh(W \cdot \frac{1}{|\mathbf{f}_c|} \sum_{f_i \in \mathbf{f}_c} \mathbf{v}_i)$$

A Representation Learning Approach



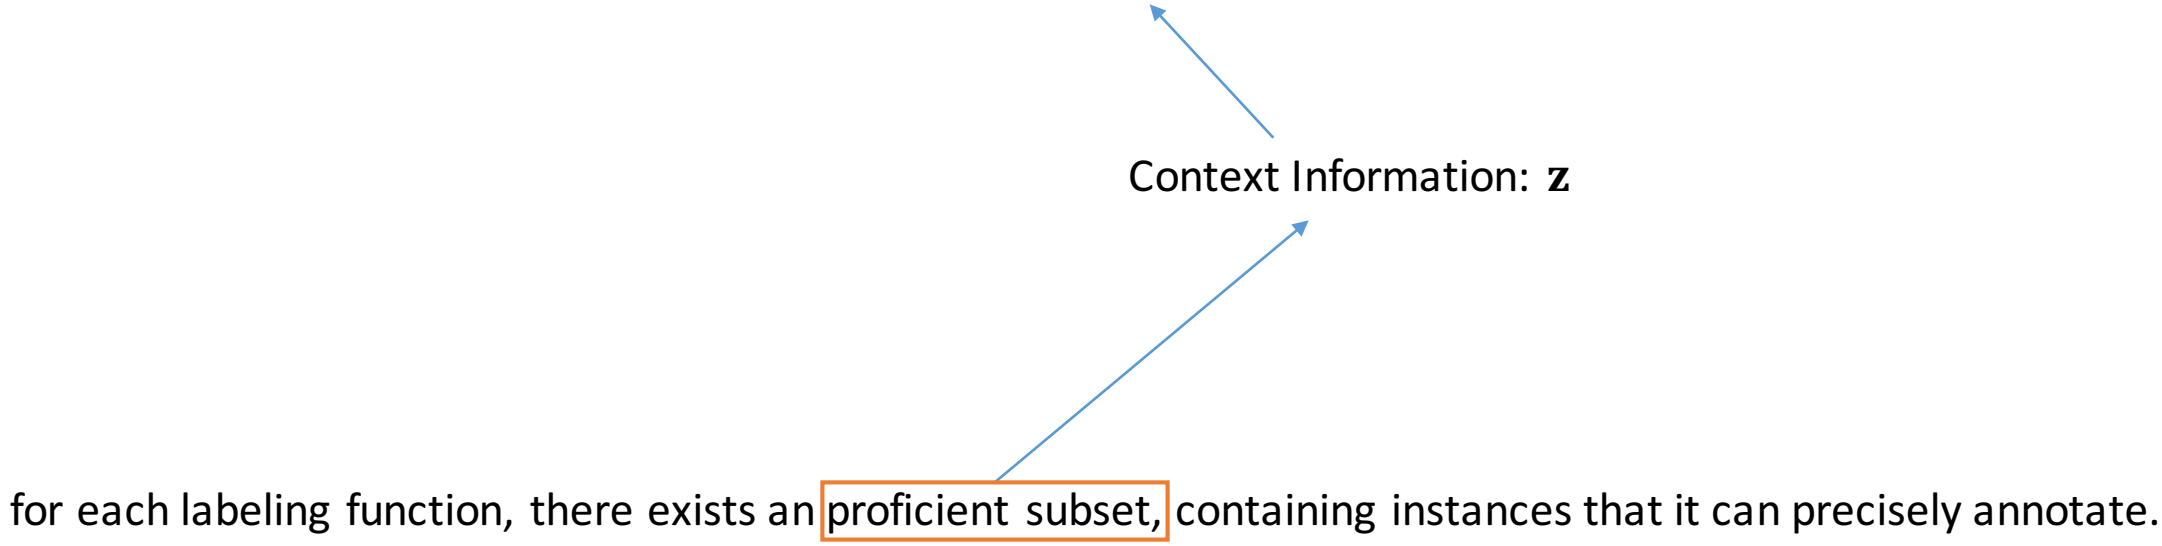
True label discovery

- Assume:
  - A labeling function would annotate similar instances with the same reliability

Context Information: $\mathbf{z}$

True label discovery

- Assume:
  - A labeling function would annotate similar instances with the same reliability



True label discovery

- How to decide which label is correct?
  - Probability model and maximum likelihood estimate

Corresponding to our assumption and setting

Identify the true label

True label discovery

- Probability Model:
  - Describing the generation of Heterogeneous Supervision?
  - Different from crowdsourcing. E.g., ONE worker may annotate:
    - ("Obama", "USA", Obama was born in Honolulu, Hawaii, USA as he has always said)
      - *Born-in* — Cautious Worker
      - *President-of*
      - *Citizen-of*
      - …

Careless Worker

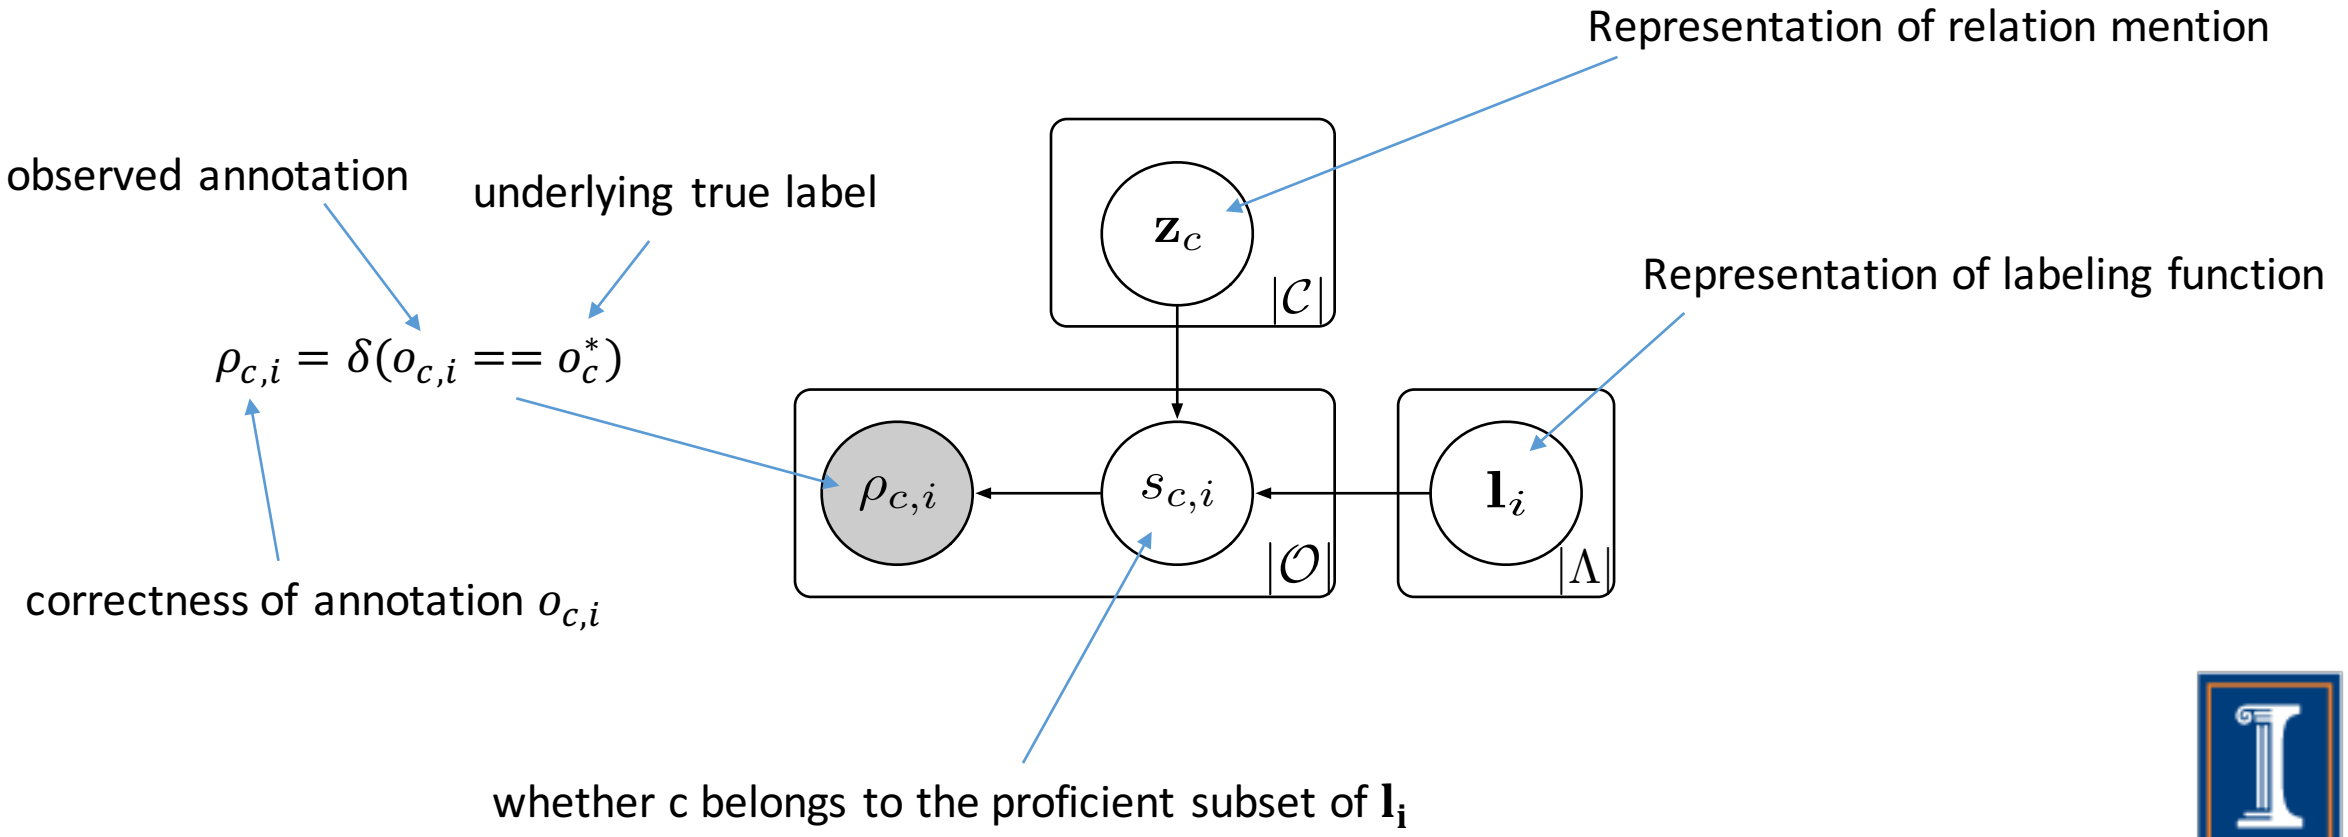
Exists some randomness

True label discovery

- Probability Model:
  - Describing the generation of Heterogeneous Supervision?
  - Different from crowdsourcing. E.g., ONE worker may annotate:
    - ("Obama", "USA", Obama was born in Honolulu, Hawaii, USA as he has always said)
      - *Born-in*
      - *President-of*
      - *Citizen-of*
      - …
  - But One labeling function can only annotate One relation type:
    - Randomness exists in the correctness, not in the choice of relation type

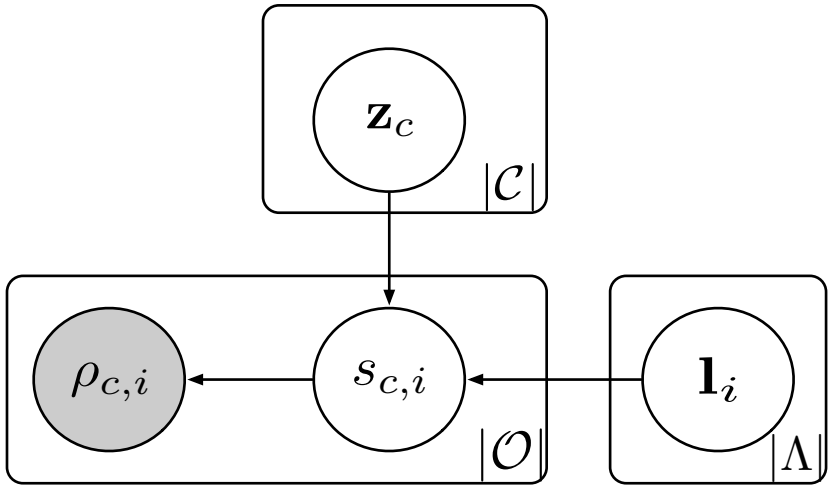
True label discovery

- Describing the correctness of Heterogeneous Supervision

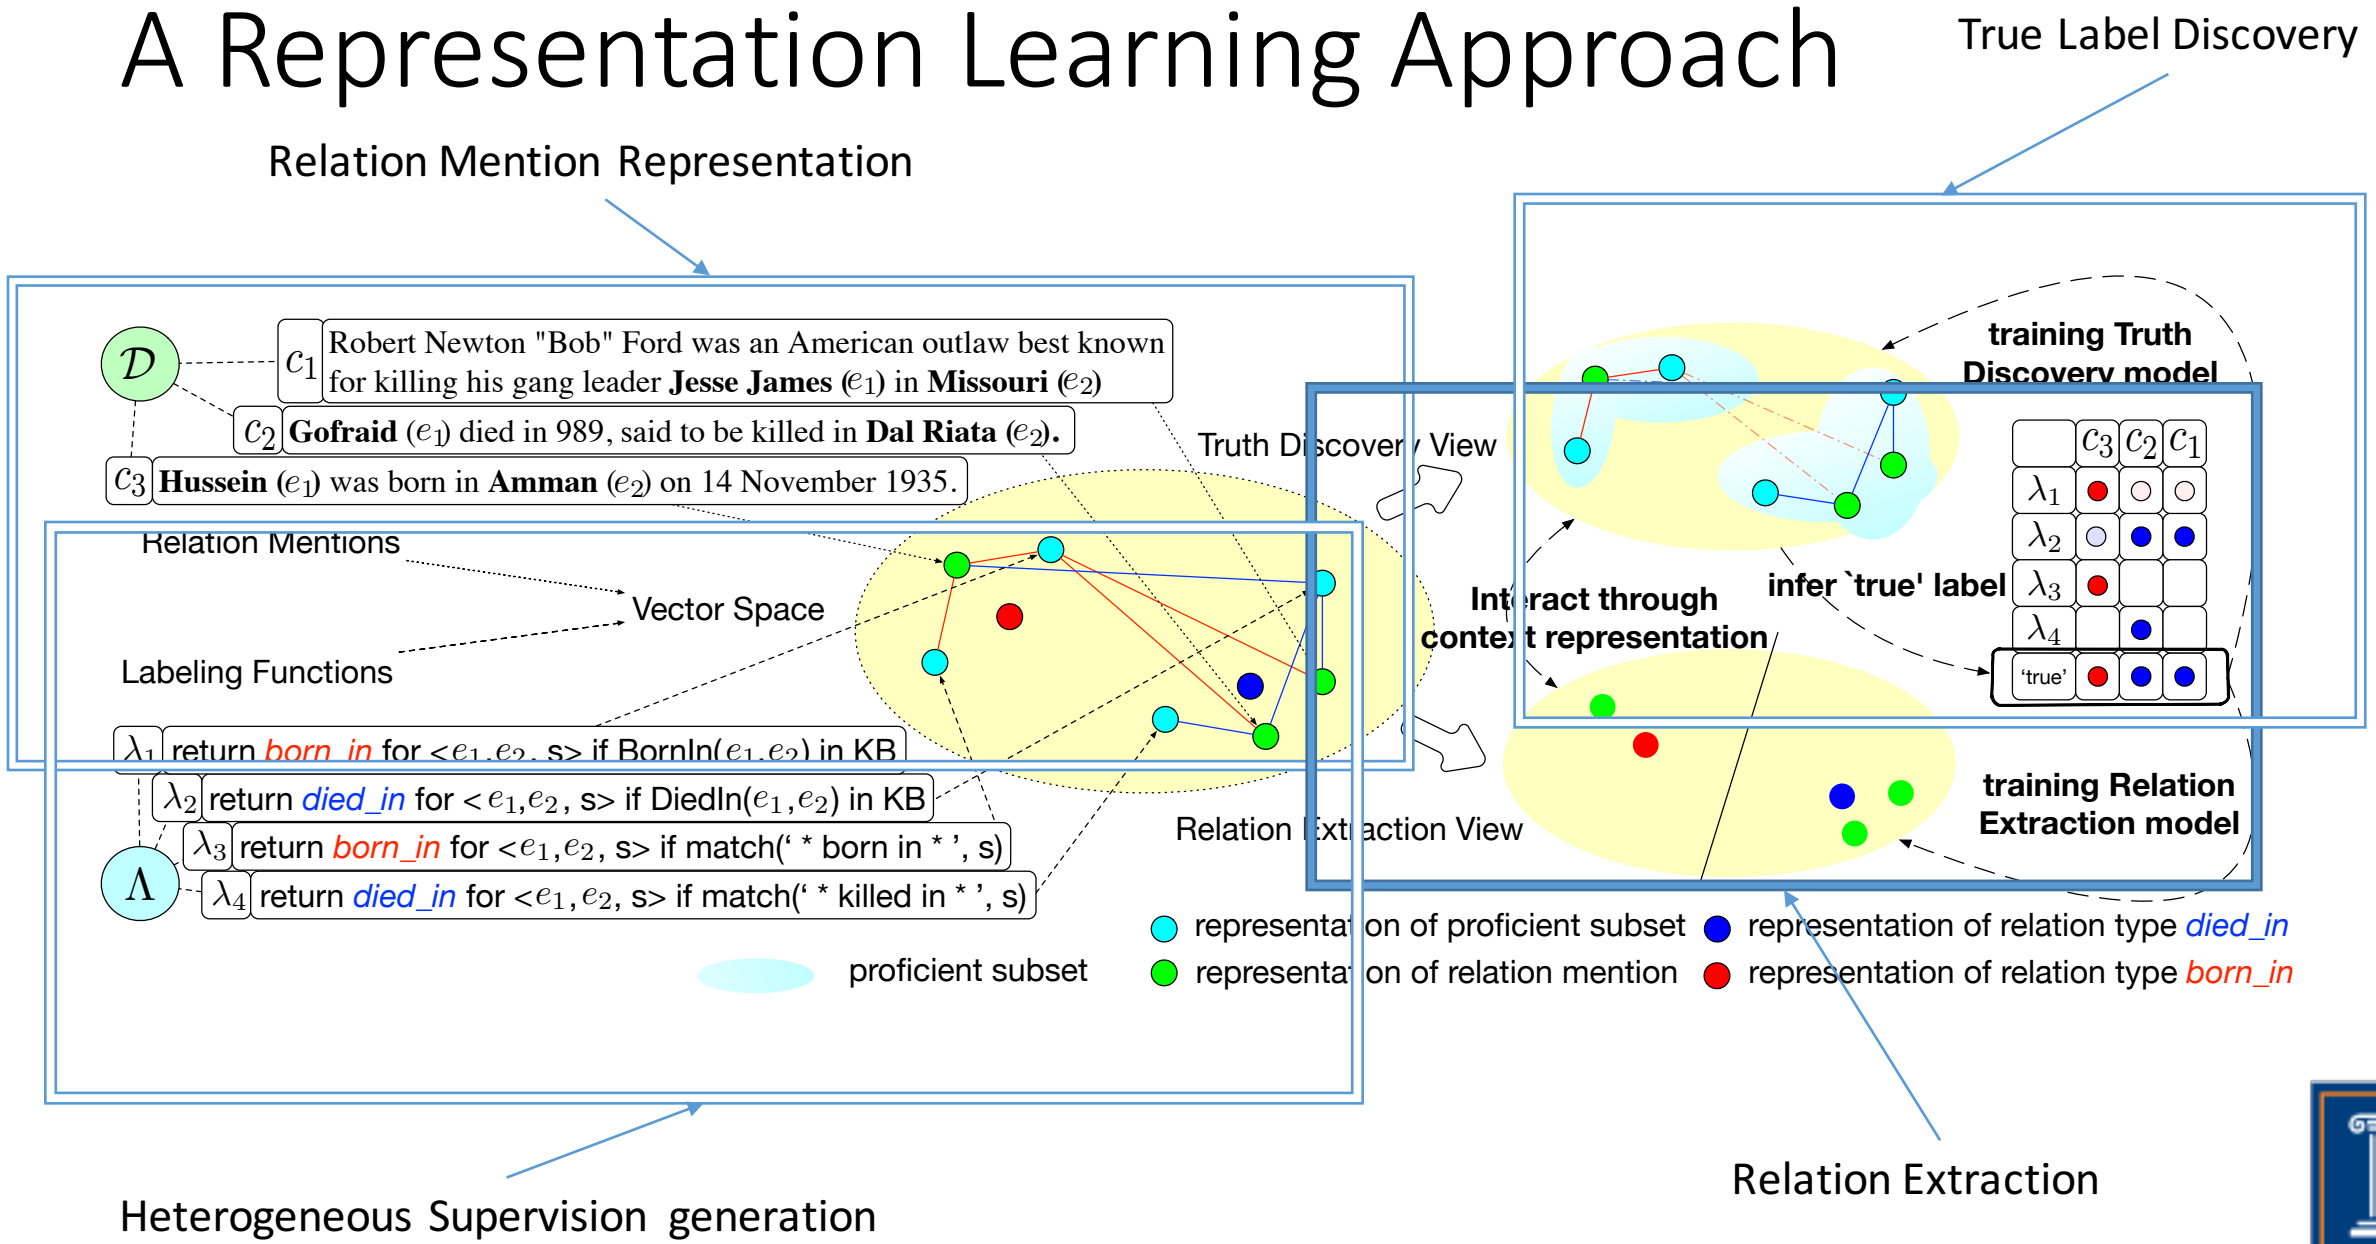


True label discovery

- Describing the correctness of Heterogeneous Supervision
  - $p(\rho_{c,i}=1)=p(\rho_{c,i}=1|s_{c,i}=1)*p(s_{c,i}=1)+p(\rho_{c,i}=1|s_{c,i}=0)*p(s_{c,i}=0)$
  - $p(s_{c,i}=1)=\sigma(\mathbf{l}_i^t*\mathbf{z}_c)$
  - $\mathcal{J}_T=\sum_{o_{c,i}\in\mathcal{O}}\log(\sigma(\mathbf{z}_c^T\mathbf{l}_i)\phi_1^{\delta(o_{c,i}=o_c^*)}(1-\phi_1)^{\delta(o_{c,i}\neq o_c^*)}$
    $+(1-\sigma(\mathbf{z}_c^T\mathbf{l}_i))\phi_0^{\delta(o_{c,i}=o_c^*)}(1-\phi_0)^{\delta(o_{c,i}\neq o_c^*)})$



A Representation Learning Approach



Relation Extraction

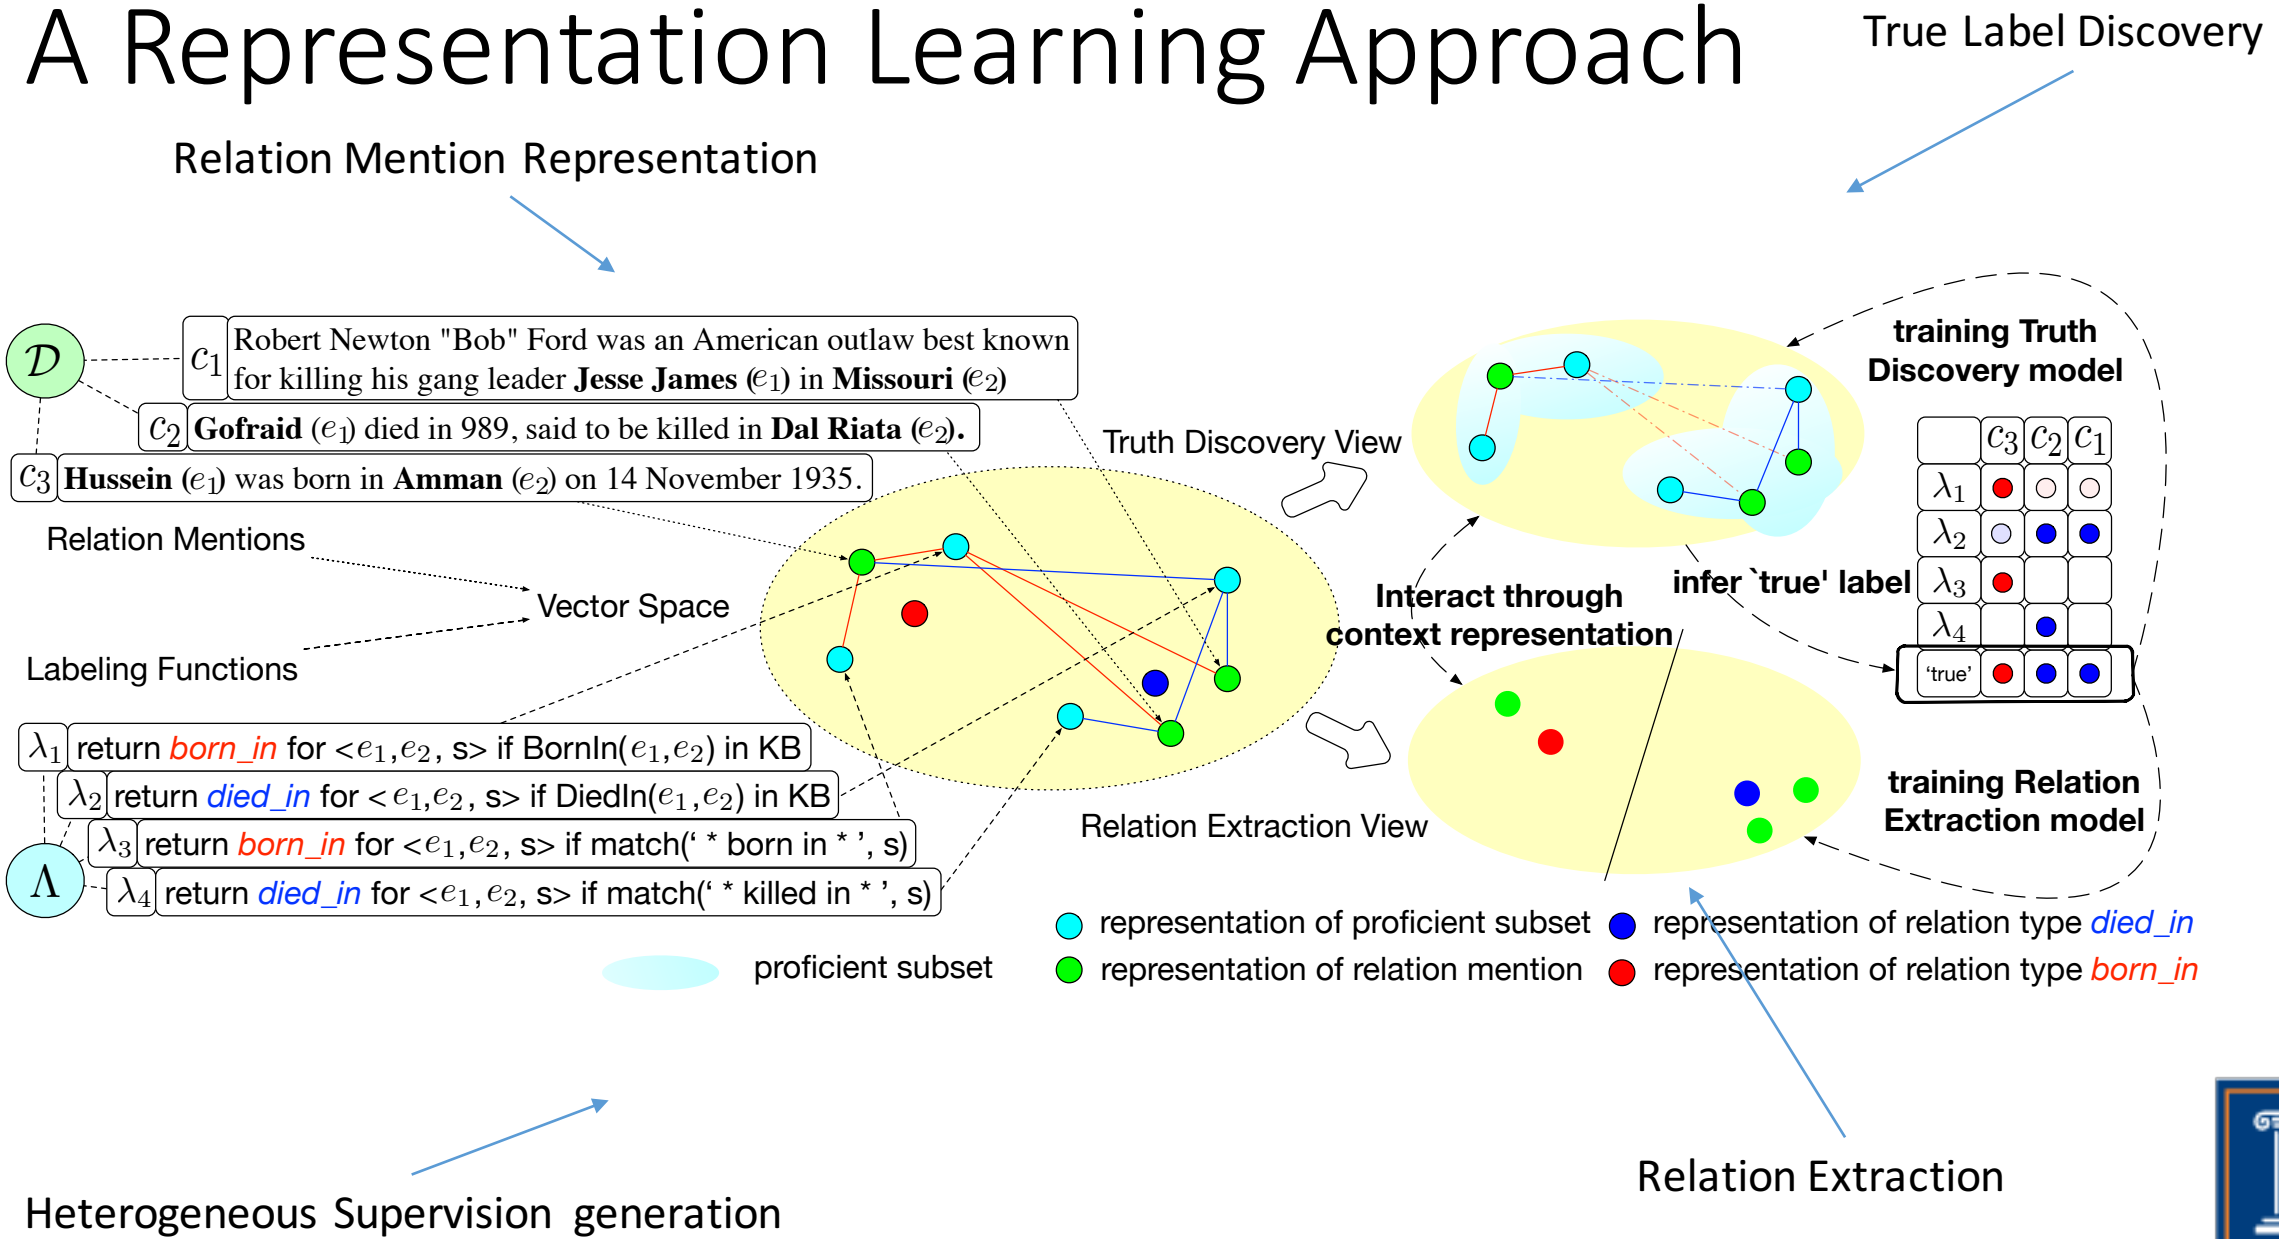
- Adopts soft-max as the relation extractor:

$$p(r_i|\mathbf{z}_c) = \frac{\exp(\mathbf{z}_c^T \mathbf{t}_i)}{\sum_{r_j \in \mathcal{R} \cup \{\texttt{None}\}} \exp(\mathbf{z}_c^T \mathbf{t}_j)}$$

- Loss function: KL-Divergence:

$$\mathcal{J}_R = -\sum_{c \in \mathcal{C}_l} KL(p(.|\mathbf{z}_c)||p(.|o_c^*))$$

A Representation Learning Approach



Model Learning

- Joint optimize three components

$$\min_{W,\mathbf{v},\mathbf{v}^*,\mathbf{l},\mathbf{t},o^*} \mathcal{J} = -\mathcal{J}_R - \lambda_1 \mathcal{J}_E - \lambda_2 \mathcal{J}_T$$
$$\text{s.t. } \forall c \in \mathcal{C}_l, o_c^* = \underset{o_c^*}{\text{argmax}}\, \mathcal{J}_T, \mathbf{z}_c = g(\mathbf{f}_c)$$

ReHession

- Heterogeneous Supervision
- Our Solution: A Representation Learning Approach
  - Relation Mention Representation
  - True Label Discovery component
  - Relation Extraction component
- Experiments

Experiments

- 1. Relation extraction (with None) and Relation classification (without None):
  - NL: train relation extractor with all annotations
  - TD: train relation extractor with `true' label inferred by Investment (compared true label discovery model)
